respiratory care calculations pdf: Extracorporeal Membrane Oxygenation for Adults Gregory A. Schmidt, 2022-08-10 This new edition presents an evidence-based review of extracorporeal membrane oxygenation (ECMO) for adults, with a particular focus on veno-venous (VV) ECMO. Due to the dramatic impact of COVID-19, the number of institutions offering ECMO, thus the number of clinicians performing ECMO (or referring their patients for ECMO), has exploded in a truly unprecedented way. While the pandemic may fade, programs built in response will survive by extending the application of ECMO to previously overlooked populations. This fully updated second edition refines its focus to VV ECMO, which has seen the most dramatic increase and relevance. This allows expert authors to go further in depth regarding VV ECMO and provide readers with better guidance from the physiology of VV ECMO to weaning and decannulation. Several areas have been expanded, including anti-thrombotic approaches; how to set the mechanical ventilator and judge the complex interactions between patient, ventilator, and ECMO circuit; assessing the systemic circulation during VV ECMO (especially right ventricular function and intravascular volume); and recognizing membrane lung dysfunction. Finally, new chapters addressing how the VV-capable clinician should think about VA ECMO and how to incorporate ethical principles in patient selection and withdrawal of ECMO have been added. This is an ideal guide for intensive care and respiratory medicine specialists, fellows training in critical care, ECMO specialist staff, perfusionists, nurses, and respiratory therapists.

respiratory care calculations pdf: Vaccines for the 21st Century Institute of Medicine, Division of Health Promotion and Disease Prevention, Committee to Study Priorities for Vaccine Development, 2001-03-21 Vaccines have made it possible to eradicate the scourge of smallpox, promise the same for polio, and have profoundly reduced the threat posed by other diseases such as whooping cough, measles, and meningitis. What is next? There are many pathogens, autoimmune diseases, and cancers that may be promising targets for vaccine research and development. This volume provides an analytic framework and quantitative model for evaluating disease conditions that can be applied by those setting priorities for vaccine development over the coming decades. The committee describes an approach for comparing potential new vaccines based on their impact on morbidity and mortality and on the costs of both health care and vaccine development. The book examines: Lessons to be learned from the polio experience. Scientific advances that set the stage for new vaccines. Factors that affect how vaccines are used in the population. Value judgments and ethical questions raised by comparison of health needs and benefits. The committee provides a way to compare different forms of illness and set vaccine priorities without assigning a monetary value to lives. Their recommendations will be important to anyone involved in science policy and public health planning: policymakers, regulators, health care providers, vaccine manufacturers, and researchers.
