Sample Questions and Their Answer Keys

Question 1: What is a mole?

Answer: A mole is a unit in chemistry that represents (6.022×10^{23}) particles (atoms, molecules, ions, etc.). It allows chemists to count quantities of particles in a manageable way, analogous to a dozen representing 12 items. The number (6.022×10^{23}) is known as Avogadro's number.

Question 2: How do you calculate the molar mass of a compound?

Answer: The molar mass of a compound is calculated by summing the atomic masses of all atoms in its chemical formula, expressed in grams per mole (g/mol). For example, for water (H_2O):

- Hydrogen (H): approximately 1.008 g/mol
- Oxygen (O): approximately 16.00 g/mol

Therefore, molar mass of $\text{H}_2\text{O} = (2 \times 1.008) + 16.00 = 18.016 \text{ g/mol}$.

Question 3: Convert 3 moles of carbon atoms to particles.

Answer: To convert moles to particles, multiply the number of moles by Avogadro's number:

Particles = $3 \text{ mol} \times (6.022 \times 10^{23}) \text{ particles/mol} = (1.8066 \times 10^{24}) \text{ particles}$.

Question 4: How many grams are in 2 moles of oxygen gas (O_2)?

Answer: First, find the molar mass of O_2 :

- Oxygen atomic mass: 16.00 g/mol

O_2 molar mass = $2 \times 16.00 = 32.00$ g/mol. Then multiply by moles:

Mass = $2 \text{ mol} \times 32.00 \text{ g/mol} = 64.00$ grams.

Question 5: If a sample contains (3.01×10^{23}) particles of a substance, how many moles is this?

Answer: Divide the number of particles by Avogadro's number:

Moles = (3.01×10^{23}) particles $\div (6.022 \times 10^{23})$ particles/mol ≈ 0.5 mol.
