Understanding DNA Through the Gizmo: Key Concepts

Structure of DNA

DNA (deoxyribonucleic acid) is a double-stranded molecule composed of nucleotide units. Each nucleotide consists of a sugar, a phosphate group, and a nitrogenous base. The sequence of bases encodes genetic information.

Base Pairing Rules

In DNA, adenine (A) pairs exclusively with thymine (T), and cytosine (C) pairs exclusively with guanine (G). These pairs form through hydrogen bonds, maintaining the stability of the double helix.

Antiparallel Strands

The two strands of DNA run in opposite directions—one runs 5' to 3', and the other 3' to 5'. This antiparallel orientation is essential for DNA replication and transcription.

Mutations and Genetic Variability

Mutations involve changes in the DNA sequence that can lead to genetic diversity. The Gizmo allows students to simulate mutations and understand their potential impacts on organism traits and evolution.
