bond markets analysis and strategies pdf: How Governments Borrow Ben Cormier, 2024-02-29 Sovereign debt composition enhances or limits the capacity of an Emerging Market (EM) government to contribute to social and economic development. Many EMs depend on foreign currency debt. How much external debt an EM government owes, the cost of that debt, the maturity

of that debt, and the conditions attached to that debt all determine the political and economic opportunities and risks associated with a government's borrowings. EMs borrow from different sources each year, leading them to build different sovereign debt structures over time. Some prioritize cheap yet conditional official credit, which constrains policy autonomy but enhances debt sustainability. Others prioritize comparatively expensive bond markets, which enhances policy autonomy but brings more expensive repayment obligations on to national balance sheets. As countries accumulate debt, the borrowing choices they make come to have important effects on fiscal space, debt sustainability, and development. *How Governments Borrow* shows how annual borrowing decisions are informed by domestic politics. The book traces the annual fiscal policymaking process in EMs to show how a government's partisan policy preferences are a primary determinant of annual external borrowing decisions and thus patterns of debt accumulation. That sovereign debt composition has partisan political roots provides insights for scholars in political science, international relations, economics, sociology, and public administration that work on sovereign debt.--Publisher.

bond markets analysis and strategies pdf: *The Political Economy of Green Bonds in Emerging Markets* Manuel Neumann, 2023-05-17 Funding low-carbon transitions to address climate change is one of the major challenges of our time. Green bonds have emerged as a powerful tool to enlist institutional investors' wealth for these transitions. But despite exponential growth in many parts of the world, the green bond market in South Africa has been stalling. This book project grapples with this puzzle. Firstly, it debunks some of the promises underpinning green bond markets and traces the manifold practices undergirding its promotion. Secondly, it identifies some barriers prohibiting the expansion of green bonds in emerging markets and zooms in on the depoliticizing tendencies a transition premised on financial innovation produces. Thirdly, this work discloses the idiosyncratic political economic challenges of a fossil-based economy in transition and shines a light on the competing elements of a 'green' and a 'just' transition. It argues that the limited uptake of green bonds can best be explained by the instrument's inability to adequately incorporate the various demands levied on South Africa's contested transition trajectory. In so doing, this book contributes important new qualitative insights into green bond markets-in-the-making and extends political economic scholarship on finance-led transition endeavors in emerging markets. Chapters 3 and 6 is available open access under a Creative Commons Attribution 4.0 International License via link.springer.com.

lengths of few such compounds, you can derive a very accurate linear correlation between the bond length and the frequency. So while you can't

Lost atoms in LAMMPS - Matter Modeling Stack Exchange HI @Magic_Number, after running with more recorded timestep, I think the main reason is because the molecule pass through zlo and have atom deleted, as result, the bond

Maximum bond length in Vesta - Matter Modeling Stack Exchange I need some cutoff radii to count bonds between different atoms in my system. When a .cif file is opened in Vesta, there are some default values of min and max bond lengths

Scanning two bond lengths G-16 - Matter Modeling Stack Exchange When you are scanning two bond lengths in Gaussian, you step once through the first bond scan, and complete stepping through the second bond scan. For example, consider

Interpreting electron localization function (ELF) results From the QTAIM analysis we got the the lead make a bond with one nitrogen atom at the nanostructure surface. This is due to the interbasin path together with the bond critical point

visualization software - How to add a bond between two atoms in I want to add a bond between specific atoms. I found on VMD page that one can use topotools (e.g. topo addbond 1 2), but I have a lot of residues so this method didn't work

How to canonicalize SMILES written with aromatic bond symbols (:)? I am using a package called PySmiles and it is returning a dialect of SMILES for aromatic groups that uses aromatic bond symbols e.g. NC:1:N:N:C:[N]1N. RDKit does not

Is it possible to do a Gaussian redundant scan with some fixed bonds? The last line indicates that the bond (B) between atoms 5 and 6 are scanned (S) with 20 steps of size -0.1 Angstrom. In the image you posted in the question, the bond

What are the types of bond orders? - Matter Modeling Stack Laplacian Bond Order This method is an extension of the QTAIM (Quantum Theory of Atoms In Molecules) concept of using the Laplacian of the electron density $\nabla^2\rho$ to

How may I calculate the bond length between two atoms? Bond formation could be something like 1-P \$ _ {break} \$. You could also run quantum calculations for all possible pairs (or higher order clusters) of atoms or hit the
