Frequently Asked Questions

What are the main differences between the axial and appendicular skeletons in Exam 2 Anatomy and Physiology?

The axial skeleton includes the skull, vertebral column, and thoracic cage, providing support and protection for the central nervous system and vital organs. The appendicular skeleton consists of the limbs and girdles (pectoral and pelvic), facilitating movement and interaction with the environment.

How do muscle fibers function during contraction in Exam 2 Physiology?

Muscle fibers contract through the sliding filament mechanism, where actin and myosin filaments slide past each other, shortening the sarcomere. This process is triggered by neural stimuli releasing calcium ions, leading to cross-bridge formation and force generation.

What is the significance of the nervous system in regulating the cardiovascular system, as covered in Exam 2?

The nervous system, particularly the autonomic nervous system, regulates heart rate and blood vessel diameter to maintain blood pressure and ensure adequate blood flow, responding to changes in activity, stress, and body position.

In Exam 2 Anatomy, how are the different types of connective tissues classified and what are their functions?

Connective tissues are classified into loose connective tissue (support, insulation), dense connective tissue (tendons and ligaments for strength), cartilage (flexible support), bone (rigid support and mineral storage), and blood (transport). Each type has specialized functions based on its composition.

What are the key features of the respiratory system covered in Exam 2 Physiology?

The respiratory system facilitates gas exchange, bringing oxygen into the lungs and removing carbon dioxide. Key features include the alveoli for gas exchange, the diaphragm and intercostal muscles for breathing, and airways like the trachea and bronchi.

How does the endocrine system influence homeostasis as discussed in Exam 2?

The endocrine system regulates homeostasis by secreting hormones that control processes such as metabolism, growth, and electrolyte balance. Glands like the thyroid, adrenal, and pancreas play vital roles in maintaining internal stability.

What are the major structural components of a neuron studied in Exam 2 Anatomy and Physiology?

A neuron consists of three main parts: the cell body (soma), dendrites (receivers of signals), and the axon (transmits signals). These structures work together to process and transmit nerve impulses throughout the nervous system.
