pn comprehensive predictor 2023: *Body Composition Assessment and Future Disease Risk* Arch Mainous, Frank A. Orlando, Ara Jo, Velyn Wu, 2025-05-21 Body composition, like excess adiposity and muscle mass, has been shown to be associated with the risk of diseases including diabetes, cancer and cardiovascular disease. Moreover, body composition is directly associated with mortality risk. Consequently, assessment of a patient's body composition is one of the most common risk stratification variables that is collected. In particular, body mass index (BMI) is assessed for essentially every adult and is used to drive treatment decisions. However, BMI, which is easy to measure in a doctor's office and a standard measurement to define obesity, has been shown to have some limitations as a risk predictor for different populations. For example, BMI is not as predictive in Asian populations who may have a higher proportion of visceral fat and increased risk of cardiometabolic disorder. Similarly, as patients age they tend to lose lean muscle mass which may contribute to disease risk, and healthy patients with a muscular physique may have an elevated BMI. This has led to concepts like sarcopenic obesity and normal weight obesity. BMI is a screening tool, and clinicians should be aware of proper use of BMI when counselling patients and other assessments of body composition.

pn comprehensive predictor 2023: Novel Insights into the Comorbidities and Mortality in Patients with Diabetes Sen Li, Hongcai Shang, Ping Wang, Haiqiang Dou, 2024-04-19 Diabetes is a metabolic disorder of chronic hyperglycemia that causes numerous complications. The International Diabetes Federation and World Health Organization report that approximately 537 million people worldwide have diabetes in 2021, which may increase to 700 million by 2045. Diabetes and its complications significantly lower the quality of life of patients and cause more than

4 million deaths yearly. Diabetes and its complications also increase premature mortality, increasing society's economic burden. Numerous studies reveal that the chronic multisystem injury and dysfunction can be caused by diabetes, including cardiac and cerebral vascular lesions, nephropathy, retinopathy and neuropathy. In addition, diabetes usually co-occurs with other diseases that may have certain risk factors in common. For example, patients with diabetes are more likely to have hypertension, chronic obstructive pulmonary disease, or asthma. However, there is still a lack of knowledge on the relationship between diabetes and other potential comorbidities such as hepatitis infection, hearing impairment and periodontal disease. Furthermore, common risk factors contributing to the pathogenesis of diabetes and comorbidities are far from fully understood. Several comorbidities (e.g., cardiovascular and cerebrovascular diseases) raise the extra chances of death in patients with diabetes, but the association between diabetes and mortality of other diseases, such as endometrial or kidney cancer, is inconsistent. Further research is still needed to reveal the excess mortality associated with diabetic comorbidities.
