gfta 3 scoring manual: Autism: The Movement (Sensing) Perspective a Decade Later Elizabeth B. Torres, Jonathan T. Delafield-Butt, Vikram K. Jaswal, Susan Crawford, Ashok Srinivasan, Brittany Travers, 2025-08-19 A decade ago, in 2013, the Research Topic Autism the Movement Perspective, proposed the radical idea that using movement and its sensations could help us better understand the many complex layers of autism spectrum disorders. Inspired by earlier work from other fields, the work positioned front and center approaches from neuromotor control, infusing the research with new computational ideas to study autism across the human lifespan. Through the lens of motor variability as a form of kinesthetic reafference, causal inference and predictive codes, the Research Topic brought together a group of researchers, parents, practitioners, and self-advocates to rethink autism as sensory motor differences contributing to the emergence of powerful coping mechanisms that advanced our understanding of how the human brain develops and functions. Today, with new improvements in biosensing technologies, and neuroscience, and the embodied and affective psychology on which development is based, we revisit this Research Topic, approaching autism anew through a modernized lens of precision aimed at enabling socio-motor agency.
