Sample Problems and Solutions from the Answer Key

Problem 1: Calculating Range of a Projectile

Question:

A projectile is launched from the ground at an initial speed of 20 m/s at an angle of 45°. What is its approximate range?

Solution Overview:

- Use the projectile range formula:

$$R = \frac{v^2 \sin 2\theta}{g}$$

- Plug in values:

$$v = 20 \text{ m/s}, \theta = 45^\circ, g = 9.8 \text{ m/s}^2$$

Calculation:

$$\sin 2\theta = \sin 90^\circ = 1$$

$$R = \frac{(20)^2 \times 1}{9.8} = \frac{400}{9.8} \approx 40.82 \text{ meters}$$

Answer:

The projectile's approximate range is 40.8 meters.

Problem 2: Effect of Launch Angle on Maximum Height

Question:

How does increasing the launch angle from 30° to 60° affect the maximum height of a projectile launched with the same initial speed?

Solution Overview:

- The maximum height (H) is given by:

$$H = \frac{v^2 \sin^2 \theta}{2g}$$

- Calculate for each angle:

Calculations:

- For 30° :

$$H_{30} = \frac{(v)^2 \sin^2 30^\circ}{2g}$$

$$\sin 30^\circ = 0.5$$

$$H_{30} = \frac{v^2 \times 0.25}{2 \times 9.8}$$

- For 60° :

$$\sin 60^\circ \approx 0.866$$

$$H_{60} = \frac{v^2 \times 0.75}{2 \times 9.8}$$

Conclusion:

Since $\sin^2 60^\circ$ is greater than $\sin^2 30^\circ$, increasing the launch angle from 30° to 60° results in a higher maximum height.

Deep Dive into Typical Questions and Solutions

Example Question 1: Calculating Range

“Given an initial velocity of 20 m/s launched at an angle of 45°, what is the projectile’s range?”

Solution Approach:

1. Decompose velocity:

- Horizontal component, $v_x = v \cos \theta = 20 \times \cos 45^\circ \approx 14.14 \text{ m/s}$
- Vertical component, $v_y = v \sin \theta = 20 \times \sin 45^\circ \approx 14.14 \text{ m/s}$

2. Calculate time of flight:

$$t_{\text{total}} = \frac{2 v_y}{g} = \frac{2 \times 14.14}{9.8} \approx 2.89 \text{ seconds}$$

3. Calculate range:

$$R = v_x \times t_{\text{total}} \approx 14.14 \times 2.89 \approx 40.91 \text{ meters}$$

Answer: Approximately 41 meters.

Example Question 2: Interpreting Graph Data

“Explain how increasing the launch angle affects the maximum height and range of the projectile.”

Sample Explanation:

- Increasing the launch angle generally increases the maximum height because the vertical component of velocity becomes larger.
- The range initially increases with the angle, peaking around 45°, then decreases as the angle approaches 90°, because the horizontal component diminishes.
- Therefore, the optimal angle for maximum range in the absence of air resistance is approximately 45°, while for maximum height, a higher angle (closer to 90°) is ideal.
