This is the ideal book for selecting plants, planning a border, a greenhouse, or a

whole garden, and for identifying plants, and it contains a wealth of information on their appearance and cultivation. The 8,000 plants described cover suitability for every climate, including house and conservatory plants. The book begins with a general introduction and explanation of plant names, followed by a revised and enlarged plant selector, highlighting plants suitable for particular sites, soils, conditions, and purposes. The 5,000-entry illustrated plant catalog follows, divided into eight main sections: trees, shrubs, roses, climbers, perennials, annuals and biennials, rock plants, bulbs, water plants, and cacti and other succulents. In this new edition, the sections have been re-ordered to help plants be chosen more intuitively: by color, then season, then size. Feature spreads throughout the color section illustrate a range of cultivars within the most popular genera, such as pelargoniums and clematis. Each plant variety is illustrated by a colorful photograph, and accompanied by a detailed description with cultivation requirements. The single-color, text-only plant dictionary at the back contains entries for every genus in the book, plus more than 3,000 plants in addition to those in the illustrated catalog. It also functions as an index to the plant catalog, with extensive cross-referencing. All the information needed to grow each plant is included here. Following the introduction and plant selector, the book is divided into two main sections: a 440-page, full-colour illustrated plant catalogue, and a plant dictionary featuring 8,000 plants listed alphabetically by botanical name. There is also an index of common names and glossary of terms.

I think it really fills a need in the textbook landscape. -- Marie desJardins, Dean of the College of Organizational, Computational, and Information Sciences, Simmons University *Discovering Computer Science* is a refreshing departure from introductory programming texts, offering students a much more sincere introduction to the breadth and complexity of this ever-growing field. -- James Deverick, Senior Lecturer, The College of William and Mary This unique introduction to the science of computing guides students through broad and universal approaches to problem solving in a variety of contexts and their ultimate implementation as computer programs. -- Daniel Kaplan, DeWitt Wallace Professor, Macalester College *Discovering Computer Science: Interdisciplinary Problems, Principles, and Python Programming* is a problem-oriented introduction to computational problem solving and programming in Python, appropriate for a first course for computer science majors, a more targeted disciplinary computing course or, at a slower pace, any introductory computer science course for a general audience. Realizing that an organization around language features only resonates with a narrow audience, this textbook instead connects programming to students' prior interests using a range of authentic problems from the natural and social sciences and the digital humanities. The presentation begins with an introduction to the problem-solving process, contextualizing programming as an essential component. Then, as the book progresses, each chapter guides students through solutions to increasingly complex problems, using a spiral approach to introduce Python language features. The text also places programming in the context of fundamental computer science principles, such as abstraction, efficiency, testing, and algorithmic techniques, offering glimpses of topics that are traditionally put off until later courses. This book contains 30 well-developed independent projects that encourage students to explore questions across disciplinary boundaries, over 750 homework exercises, and 300 integrated reflection questions engage students in problem solving and active reading. The accompanying website — <https://www.discoveringcs.net> — includes more advanced content, solutions to selected exercises, sample code and data files, and pointers for further exploration.
