

macromolecules chart.

macromolecules chart. Understanding the fundamental building blocks of life is essential for students, educators, and anyone interested in biology or biochemistry. A macromolecules chart serves as a visual guide that simplifies complex information about the four primary types of macromolecules—carbohydrates, proteins, lipids, and nucleic acids. These large, complex molecules are essential for various biological functions, including energy storage, structural support, genetic information transmission, and catalysis of biochemical reactions. Creating a comprehensive macromolecules chart helps in grasping their structures, functions, and differences, making it an invaluable resource for learning and reference.

What Are Macromolecules?

Definition and Importance

Macromolecules are large, complex molecules vital for life. They are composed of thousands of atoms and are usually formed through polymerization, where smaller units called monomers link together to form larger structures. These molecules are essential because they perform a wide array of functions necessary for the survival and proper functioning of living organisms.

Types of Macromolecules

There are four main categories of macromolecules:

- Carbohydrates
- Proteins
- Lipids
- Nucleic acids

Each category has unique structural characteristics and functions, which are summarized on a macromolecules chart for easy comparison.

Carbohydrates

Structure and Types

Carbohydrates are organic molecules composed of carbon, hydrogen, and oxygen, typically with a hydrogen to oxygen ratio of 2:1. They are primarily used for energy storage and supply, as well as structural support in cell walls.

Main types of carbohydrates include:

- Monosaccharides: Simple sugars like glucose, fructose, and galactose.
- Disaccharides: Formed by two monosaccharides linked together, e.g., sucrose (table sugar), lactose, and maltose.
- Polysaccharides: Complex carbohydrates made of many monosaccharide units, such as starch, glycogen, and cellulose.

Functions of Carbohydrates

- Primary energy source for cells
- Structural component in plant cell walls (cellulose)
- Energy storage (glycogen in animals, starch in plants)
- Participate in cell recognition and signaling

Carbohydrate Chart Summary

Type	Monomers/Units	Examples	Functions
Monosaccharides	Single sugar molecules	Glucose, fructose	Quick energy, metabolic intermediates
Disaccharides	Two monosaccharides linked	Sucrose, lactose	Energy source
Polysaccharides	Many monosaccharides linked	Starch, glycogen, cellulose	Energy storage, structural support

Proteins

Structure and Composition

Proteins are complex molecules composed of amino acids linked together by peptide bonds. There are 20 standard amino acids, each with unique side chains that determine their properties.

Levels of protein structure:

- Primary structure: Sequence of amino acids.
- Secondary structure: Alpha helices and beta sheets formed by hydrogen bonding.
- Tertiary structure: Overall 3D shape of a single polypeptide.
- Quaternary structure: Assembly of multiple polypeptides into a functional protein.

Functions of Proteins

- Enzymatic activity (catalysts for biochemical reactions)
- Structural support (collagen, keratin)
- Transport (hemoglobin, membrane channels)
- Signaling (hormones like insulin)
- Immune response (antibodies)

Protein Chart Summary

Component	Building Blocks	Examples	Functions
Amino acids	20 standard amino acids	Glycine, alanine	Structural, enzymatic, signaling functions
Peptide bonds	Link amino acids	N/A	Form polypeptides
Polypeptides	Chains of amino acids	Hemoglobin, insulin	Functional proteins

Lipids

Structure and Types

Lipids are hydrophobic or amphipathic molecules primarily composed of carbon, hydrogen, and oxygen, but with much less oxygen than carbohydrates. They are insoluble in water but soluble in organic solvents.

Main types of lipids:

- Fatty acids: Saturated and unsaturated.

- Triglycerides: Composed of glycerol and three fatty acids, used for energy storage.
- Phospholipids: Major component of cell membranes, containing hydrophilic heads and hydrophobic tails.
- Steroids: Lipid molecules with four fused rings, such as cholesterol, testosterone, and estrogen.

Functions of Lipids

- Long-term energy storage
- Building cell membranes (phospholipids)
- Signaling molecules (steroids)
- Cushioning and insulation

Lipid Chart Summary

Type	Structure	Examples	Functions
Fatty acids	Hydrocarbon chain with carboxyl group	Saturated, unsaturated fats	Energy storage, membrane fluidity
Triglycerides	Glycerol backbone + 3 fatty acids	Fats and oils	Energy storage
Phospholipids	Glycerol + 2 fatty acids + phosphate group	Phosphatidylcholine	Cell membrane structure
Steroids	Four fused rings	Cholesterol, testosterone	Hormonal signaling

Nucleic Acids

Structure and Components

Nucleic acids are molecules that store and transmit genetic information. They are composed of nucleotide monomers, each consisting of three parts:

- A nitrogenous base (adenine, thymine, cytosine, guanine, uracil)
- A five-carbon sugar (ribose or deoxyribose)
- A phosphate group

Main types:

- DNA (Deoxyribonucleic acid): Stores genetic information.
- RNA (Ribonucleic acid): Involved in protein synthesis.

Functions of Nucleic Acids

- Genetic information storage (DNA)
- Protein synthesis (RNA)
- Regulation of gene expression

Nucleic Acid Chart Summary

Component	Description	Examples	Functions
Nucleotides	Basic units with nitrogenous base, sugar, phosphate	A, T, C, G, U	Genetic coding, protein synthesis
DNA	Double helix of nucleotides	Human genome	Genetic material in most organisms
RNA	Single-stranded nucleic acid	mRNA, tRNA, rRNA	Protein synthesis, gene regulation

Comparison of Macromolecules

Creating a macromolecules chart that compares the four types helps in understanding their unique and shared features:

- **Structural Differences:** Carbohydrates are made of sugar units, proteins from amino acids, lipids from fatty acids and glycerol, and nucleic acids from nucleotides.
- **Functional Roles:** Energy provision (carbohydrates, lipids), structural support (proteins, lipids), genetic information (nucleic acids), enzymatic activity (proteins).
- **Monomer Units:** Monosaccharides, amino acids, fatty acids, nucleotides.
- **Polymer Formation:** Polymerization links monomers into large molecules, essential for biological functions.

Using the Macromolecules Chart Effectively

A well-designed macromolecules chart can serve as:

- A quick reference guide during studies or teaching.
- An aid in visualizing the similarities and differences between macromolecules.
- A foundation for understanding biochemical pathways and cellular processes.

To maximize its utility:

- Include diagrams illustrating molecular structures.
- Use color coding to differentiate types.
- Incorporate examples relevant to different organisms.

Conclusion

Understanding macromolecules is fundamental to grasping biological sciences. The macromolecules chart provides an organized and visual summary of the complex information about these essential molecules, making it easier to learn, teach, and recall their structures, functions, and significance. Whether used as a study aid or a teaching tool, a comprehensive macromolecules chart is invaluable for exploring the molecular foundation of life.

Remember: Mastery of macromolecules not only enhances your understanding of biology but also provides insights into how life functions

Frequently Asked Questions

What are the four main types of macromolecules shown on the chart?

The four main types are carbohydrates, lipids, proteins, and nucleic acids.

How are macromolecules classified based on their

monomers?

They are classified into monosaccharides for carbohydrates, fatty acids and glycerol for lipids, amino acids for proteins, and nucleotides for nucleic acids.

What is the primary function of proteins according to the chart?

Proteins serve functions such as enzyme activity, structural support, transport, and signaling within cells.

Which macromolecule is mainly responsible for storing genetic information?

Nucleic acids, specifically DNA and RNA, are responsible for storing genetic information.

How are lipids represented on the macromolecules chart?

Lipids are shown as fatty acids and glycerol, highlighting their role in energy storage and cell membrane formation.

What is the significance of the structural differences between monosaccharides and polysaccharides?

Monosaccharides are simple sugars that serve as quick energy sources, while polysaccharides are complex carbs that provide long-term energy storage and structural support.

Why are nucleic acids considered essential macromolecules?

They are essential because they carry and transmit genetic information and are involved in protein synthesis.

What role do lipids play in cell membrane structure as depicted on the chart?

Lipids, particularly phospholipids, form the bilayer of cell membranes, providing barrier and fluidity functions.

How can understanding the macromolecules chart help in studying biology?

It provides a visual overview of the structure, function, and classification of essential biomolecules, aiding in comprehension of biological processes.

Macromolecules Chart: A Comprehensive Guide to the Building Blocks of Life

Introduction

macromolecules chart. In the intricate tapestry of life, understanding what constitutes living organisms is fundamental. At the core of biological systems lie macromolecules—large, complex molecules that perform a vast array of functions necessary for life. A macromolecules chart offers a visual roadmap that simplifies the complexity of these essential biomolecules, making it easier for students, educators, and scientists alike to grasp their structures, functions, and significance. From carbohydrates fueling cellular activities to proteins catalyzing reactions and nucleic acids storing genetic information, macromolecules are the molecular backbone of biology. This article explores the comprehensive details encapsulated in a macromolecules chart, providing an in-depth look at each major category, their subunits, and their vital roles in maintaining life.

Overview of Macromolecules

What Are Macromolecules?

Macromolecules are large, complex molecules formed by the polymerization of smaller units called monomers. These molecules are fundamental to all forms of life, forming the structural framework of cells, facilitating biochemical reactions, and carrying genetic information. They are characterized by their size, structure, and diversity of functions.

The Four Major Types of Macromolecules

The macromolecules chart typically categorizes these molecules into four primary classes:

1. Carbohydrates
2. Lipids
3. Proteins
4. Nucleic Acids

Each class plays unique roles in biological systems, with distinct structures and properties. Understanding their differences is key to deciphering the

complex web of life.

Carbohydrates: The Energy Providers

Structure and Classification

Carbohydrates are organic molecules composed of carbon (C), hydrogen (H), and oxygen (O), generally in a 1:2:1 ratio. They are primarily classified into:

- Monosaccharides: Simplest sugars like glucose and fructose.
- Disaccharides: Composed of two monosaccharides linked together, e.g., sucrose (table sugar) and lactose.
- Polysaccharides: Complex carbohydrates like starch, glycogen, and cellulose.

Functions of Carbohydrates

- Primary Energy Source: Glucose and other simple sugars provide immediate energy.
- Energy Storage: Polysaccharides like glycogen (in animals) and starch (in plants) serve as long-term energy reserves.
- Structural Components: Cellulose provides structural support in plant cell walls, while chitin strengthens the exoskeletons of insects and fungi.

Visual Representation in the Chart

A typical macromolecules chart displays carbohydrates with their monomeric units (monosaccharides), linking them to form disaccharides and polysaccharides, illustrating their hierarchical structure.

Lipids: The Fatty Acids and Their Roles

Structure and Diversity

Lipids are hydrophobic molecules primarily composed of long hydrocarbon chains or rings. Unlike other macromolecules, they are not always polymers but are grouped based on similar properties. Key types include:

- Fatty Acids: Saturated and unsaturated, serving as building blocks.
- Triglycerides: Comprising glycerol and three fatty acids; common fats and oils.
- Phospholipids: Major components of cell membranes, with hydrophilic heads and hydrophobic tails.
- Steroids: Cholesterol and hormones like estrogen and testosterone.

Functions of Lipids

- Energy Storage: Lipids contain more energy per gram than carbohydrates.
- Membrane Structure: Phospholipids form the bilayer of cell membranes.
- Signaling Molecules: Steroids act as hormones, facilitating communication within organisms.
- Insulation and Protection: Fat deposits insulate organs and provide physical cushioning.

Lipids in the Chart

While lipids are not always depicted as polymers, a macromolecules chart often includes their structural formulas, highlighting the diversity and functions of each lipid type.

Proteins: The Workhorses of the Cell

Building Blocks and Structure

Proteins are complex macromolecules composed of amino acids linked by peptide bonds. There are 20 standard amino acids, each with unique side chains (R groups). The structure of proteins can be described at four levels:

- Primary Structure: The sequence of amino acids.
- Secondary Structure: Local folding patterns like alpha-helices and beta-sheets.
- Tertiary Structure: Overall three-dimensional folding.
- Quaternary Structure: Assembly of multiple polypeptide chains.

Functions of Proteins

- Enzymatic Catalysts: Accelerate biochemical reactions.
- Structural Components: Form part of the cytoskeleton, connective tissues.
- Transport and Storage: Hemoglobin transports oxygen; ferritin stores iron.
- Communication: Hormones like insulin regulate physiological processes.
- Defense: Antibodies in immune responses.

Visual Elements in the Chart

The chart illustrates amino acids as monomers, linked via peptide bonds to form polypeptides. It often emphasizes the diversity of side chains and how they influence protein structure and function.

Nucleic Acids: The Genetic Blueprint

Composition and Types

Nucleic acids include DNA (deoxyribonucleic acid) and RNA (ribonucleic acid). They are composed of monomers called nucleotides, each consisting of:

- Nitrogenous Base: Adenine, thymine, cytosine, guanine (DNA); uracil replaces thymine in RNA.
- Pentose Sugar: Deoxyribose in DNA; ribose in RNA.
- Phosphate Group: Connecting nucleotides via phosphodiester bonds.

Functions of Nucleic Acids

- Genetic Information Storage: DNA carries hereditary information.
- Protein Synthesis: RNA plays a crucial role in translating genetic code into proteins.
- Cellular Regulation: Certain nucleotides act as signaling molecules (e.g., cAMP).

Representation in the Chart

Nucleic acids are depicted as sequences of nucleotides, emphasizing the complementary base pairing in DNA (A-T, C-G) and the single-stranded nature of RNA.

Interconnections and Significance

A well-designed macromolecules chart often highlights the interconnectedness of these biomolecules. For instance:

- Carbohydrates and Lipids: Both serve as energy sources, but lipids store more energy.
- Proteins and Nucleic Acids: DNA and RNA encode the instructions for protein synthesis.
- Lipids and Proteins: Lipids form cell membranes, where proteins are embedded as functional components.

Understanding these relationships underscores the complexity and elegance of biological systems.

The Educational Value of a Macromolecules Chart

A macromolecules chart serves as an invaluable educational tool by:

- Visualizing Structures: Simplifies complex molecular architectures.
- Highlighting Functions: Connects structure to biological roles.
- Facilitating Memory: Aids in recalling classes, monomers, and key features.
- Supporting Learning: Provides a foundation for advanced topics like metabolic pathways and genetic mechanisms.

Conclusion

In the vast realm of biology, macromolecules are the vital molecules that sustain life's complexity. The macromolecules chart encapsulates this vast information into a structured, visual format, making it accessible and comprehensible. From the energy-providing carbohydrates and lipids to the functional proteins and the genetic information carriers, these molecules demonstrate nature's ingenuity in designing life at the molecular level. As science advances, understanding these foundational components continues to be essential for innovations in medicine, biotechnology, and environmental sciences. Whether used in classrooms or laboratories, a detailed macromolecules chart remains a cornerstone for anyone seeking to navigate the molecular universe of life.

Macromolecules Chart

macromolecules chart: Focus on Polymer Research Gennadiĭ Efremovich Zaikov, 2004

Polymer material science is the science of polymer materials creation, their processing, preservation and control of their operation properties. Ageing and stabilisation of polymers, as well as combustibility of polymeric materials, are broad sections of polymer material science. This collection presents articles not only on polymers, but also on some low-molecular compounds (and their reactivity), which are important for production of polymeric articles.

macromolecules chart: Handbook on the Physics and Chemistry of Rare Earths ,

2017-07-18 Handbook on the Physics and Chemistry of Rare Earths: Including Actinides, Volume 51, is a continuous series of books covering all aspects of rare earth science, including chemistry, life sciences, materials science and physics. This latest release includes chapters on the Effect of Pressure on the Interplay Between Orbital and Magnetic Ordering, Kondo Effect, Valence Fluctuation, and Superconductivity in Rare-Earth Compounds and a section on Rare-Earth: Doped Waveguide Amplifiers and Lasers. The book's main emphasis is on rare earth elements [Sc, Y, and the lanthanides (La through Lu)], but whenever relevant, information is also included on the closely related actinide elements. Individual chapters in the ongoing series consist of comprehensive, broad, up-to-date, critical reviews written by highly experienced, invited experts. The series, which was started in 1978 by Professor Karl A. Gschneidner Jr., combines, and integrates, both the fundamentals and applications of these elements with two published volumes each year. - Presents up-to-date overviews and new developments in the field of rare earths, covering both their physics and chemistry - Contains Individual chapters that are comprehensive and broad, with critical reviews - Provides contributions from highly experienced, invited experts

macromolecules chart: IB Biology Revision Workbook Roxanne Russo, 2019-10-31 Based on the 2014 DP Biology course, the 'IB Biology Revision Workbook' is intended for use by students at any stage of the two-year course. The workbook includes a wide variety of revision tasks covering topics of the Standard Level Core, Additional Higher Level and each of the four Options. The tasks include skills and applications taken directly from the guide, as well as activities aimed at consolidating learning. A section on examination preparation and other useful tools is a part of this workbook.

macromolecules chart: Microbial Phylogeny and Evolution Jan Sapp, 2005-03-03 The birth of bacterial genomics since the mid-1990s brought with it several conceptual modifications and wholly new controversies. Working beyond the scope of the neo-Darwinian evolutionary synthesis, a group of leading microbial evolutionists addresses the following and related issues, often with markedly varied viewpoints: · Did the eukaryotic nucleus, cytoskeleton and cilia also originate from symbiosis? · Do the current scenarios about the origin of mitochondria and plastids require revision? · What is

the extent of lateral gene transfer (between species) among bacteria? · Does the rDNA phylogenetic tree still stand in the age of genomics? · Is the course of the first 3 billion years of evolution even knowable?

macromolecules chart: *Optical Activity of Proteins and Other Macromolecules* Bruno Jirgensons, 2012-12-06 The application of circular dichroism (CD) to various problems involving conformation of proteins and other biopolymers is emphasized in this revised and enlarged second edition. The usefulness of CD and ORD in helping to solve structural problems is demonstrated by many examples, and the most essential data are tabulated. The author is sincerely grateful to the editors of the series Molecular Biology, Biochemistry and Biophysics, especially to Professor GEORG F. SPRINGER, M.D., for their interest in this edition, as well as to the many reviewers for their constructive criticism of the first edition of this book. Our previously unpublished work reported in this second edition was supported in part by grants from the R. A. Welch Foundation (grant G-051) and U.S. Public Health Service (grant CA-01785). Houston, September 1973 B. JIRGENSONS Preface to the First Edition Great advances have been made in the application of physical methods in the study of the structure of proteins and other biological macromolecules. Optical rotatory dispersion has been successful in solving structural problems, and a vast amount of literature has accumulated on this subject. Several review articles appeared between 1961 and 1965, but significant progress has been made since 1965. Important new studies, especially on the Cotton effects in the far ultraviolet spectrum, have rendered many previous publications obsolete so that a concise monograph should be useful at this time.

macromolecules chart: *BODIPYs and Their Derivatives: The Past, Present and Future* Hua Lu, Zhen Shen, 2020-06-15

macromolecules chart: **Handbook of Polymer Research** Gennadii Efremovich Zaikov, 2006 Polymers are substances containing a large number of structural units joined by the same type of linkage. These substances often form into a chain-like structure. Starch, cellulose, and rubber all possess polymeric properties. Today, the polymer industry has grown to be larger than the aluminium, copper and steel industries combined. Polymers already have a range of applications that far exceeds that of any other class of material available to man. Current applications extend from adhesives, coatings, foams, and packaging materials to textile and industrial fibres, elastomers, and structural plastics. Polymers are also used for most composites, electronic devices, biomedical devices, optical devices, and precursors for many newly developed high-tech ceramics. This new volume presents leading-edge research in this rapidly-changing and evolving field.

macromolecules chart: *Mutagenesis and Carcinogenesis by Ethyl Carbamate and Related Chemicals and Effects of Chemical Carcinogens and Octopine on the Growth of Normal and Crown Gall Tissues of Tobacco* Gary A. Dahl, 1979

macromolecules chart: *Cancer Research* , 1985

macromolecules chart: **Introduction to Macromolecular Binding Equilibria** Charles P. Woodbury, 2007-11-08 Macromolecules in the body form noncovalent associations, such as DNA-protein or protein-protein complexes, that control and regulate numerous cellular functions. Understanding how changes in the concentration and conformation of these macromolecules can trigger physiological responses is essential for researchers developing drug therapies to treat

macromolecules chart: **Macromolecular Synthesis in Mouse Skin Treated with Initiators, Promoters, Or Inhibitors of Carcinogenesis** Henry Hennings, 1968

macromolecules chart: *Trends in Molecular and High Molecular Science* Gennadii Efremovich Zaikov, 2005 Trends in Molecular & High Molecular Science

macromolecules chart: **Conjugated Polymers** Klaus Müllen, John R Reynolds, Toshio Masuda, 2013-10-18 Conjugated polymers are gaining a lot of interest due to their inherent functional properties and applications in plastic electronics. Their characteristic charge transporting and conducting properties produces features including coloration, photoluminescence, electroluminescence, photoconductivity, and electrochromism. In order to develop new functional polymers, researchers need the background information on the synthesis of the different polymer

systems. Conjugated Polymers focuses on the practical preparation of conjugated polymers with each chapter discussing a particular type of conjugated polymer including a general explanation of the polymer, experimental details for synthesis and characterization. Edited by world leading experts in the field of conjugated polymer synthesis, the book serves as a convenient guide for advanced undergraduate level and above.

macromolecules chart: *Development of Biopharmaceutical Drug-Device Products* Feroz Jameel, John W. Skoug, Robert R. Nesbitt, 2020-03-13 The biotechnology/biopharmaceutical sector has tremendously grown which led to the invention of engineered antibodies such as Antibody Drug Conjugates (ADCs), Bispecific T-cell engager (BITES), Dual Variable Domain (DVD) antibodies, and fusion proteins that are currently being used as therapeutic agents for immunology, oncology and other disease conditions. Regulatory agencies have raised the bar for the development and manufacture of antibody-based products, expecting to see the use of Quality by Design (QbD) elements demonstrating an in-depth understanding of product and process based on sound science. Drug delivery systems have become an increasingly important part of the therapy and most biopharmaceuticals for self-administration are being marketed as combination products. A survey of the market indicates that there is a strong need for a new book that will provide “one stop shopping” for the latest information and knowledge of the scientific and engineering advances made over the last few years in the area of biopharmaceutical product development. The new book entitled *Development of Biopharmaceutical Drug Device Products* is a reference text for scientists and engineers in the biopharmaceutical industry, academia or regulatory agencies. With insightful chapters from experts in the field, this new book reviews first principles, covers recent technological advancements and provides case studies and regulatory strategies relating to the development and manufacture of antibody-based products. It covers topics such as the importance of early preformulation studies during drug discovery to influence molecular selection for development, formulation strategies for new modalities, and the analytical techniques used to characterize them. It also addresses important considerations for later stage development such as the development of robust formulations and processes, including process engineering and modeling of manufacturing unit operations, the design of analytical comparability studies, and characterization of primary containers (pre-filled syringes and vials). Finally, the latter half of the book reviews key considerations to ensure the development and approval of a patient-centered delivery system design. This involves the evolving regulatory framework with perspectives from both the US and EU industry experts, the role of international standards, design control/risk management, human factors and its importance in the product development and regulatory approval process, as well as review of the risk-based approach to bridging between devices used in clinical trials and the to-be-marketed device. Finally, case studies are provided throughout. The typical readership would have biology and/or engineering degrees and would include researchers, scientific leaders, industry specialists and technology developers working in the biopharmaceutical field.

macromolecules chart: *Campylobacter, Helicobacter and Arcobacter* J. G. Coote, C. Thomas, Duncan E. S. Stewart-Tull, 2001

macromolecules chart: *Natural Organic Macromolecules* Bruno Jirgensons, 1962

macromolecules chart: *Design and Synthesis of Conjugated Polymers* Mario Leclerc, Jean-Francois Morin, 2010-06-24 This first systematic compilation of synthesis methods for different classes of polymers describes well-tested and reproducible procedures, thus saving time, money and chemicals. Each chapter presents the latest method for a specific class of conjugated polymers with a particular emphasis on the design aspects for organo-electronic applications. In this concise and practically oriented manner, readers are introduced to the strategies of influencing and controlling the polymer properties with respect to their use in the desired device. This style of presentation quickly helps researchers in their daily lab work and prevents them from reinventing the wheel over and over again.

macromolecules chart: *Organic Light-Emitting Materials and Devices* Zhigang Li, Zhigang Rick Li, Hong Meng, 2006-09-12 New advances offer flexible, low-cost fabrication methods

for light-emitting materials, particularly in display technologies. As researchers continue to develop novel applications for these materials, feasible solutions for large-scale manufacturing are increasingly important. Organic Light-Emitting Materials and Devices covers all aspects of

macromolecules chart: Advances in Dendritic Macromolecules G.R. Newkome, 2002-02-14
The series Advances in Dendritic Macromolecules aims to cover the synthesis and supramolecular chemistry of dendritic or cascade super-molecules as well as their less perfect hyperbranched cousins. This volume demonstrates the novel and varied growth in this topic and certainly pushes the supramolecular concepts of Lehn into the budding supramacro-molecular frontier. In Chapter 1, Villavicencio and McGrath present their pivotal work in the creation of azobenzene-containing dendrimers; their Chapter describes the fundamental underpinnings to this interesting family. As they state in their summation, A continuing combination of fundamental studies on the photomodulation of dendrimer properties in azobenzene-containing dendrimers and the new developments in the application of these materials to new and existing technologies is anticipated. The field of linear - dendritic block copolymers is summarized in Chapter 2 from the eyes of Ivan Gitsov, who along with Professor Fréchet were the initiators of this variety of macromolecules. In Chapter 3, Astruc and colleagues present the recent advances in metallodendrimers, which incorporate ferrocenyl and/or other transition metal sandwich components; their Chapter capitalizes on the importance of supramolecular chemistry in these dendritic constructs. Finally, in Chapter 4, Wiener and Narayanan describe the practical applications of dendrimers to the area of magnetic resonance imaging contrast agents. Each of these unique chapters covers a different perspective of this versatile group of macromolecules.

macromolecules chart: Some Carcinogenic, Mutagenic, and Biochemical Properties of Platinum Antitumor Coordination Complexes and of S-vinyl- and S-ethylhomocysteine
