Sample Maintenance Technician Test Questions and Model Answers

To illustrate the type and depth of questions one might encounter, here are several examples with detailed explanations.

Electrical Troubleshooting

Q: A three-phase motor fails to start. The motor's contactor clicks but the motor doesn't turn. What is the most probable cause?

- a) Blown fuse in the circuit
- b) Faulty start capacitor
- c) Broken belt drive

d) Overheated motor

A: a) Blown fuse in the circuit

Explanation: When a contactor clicks but the motor doesn't turn, it often indicates that power is being supplied but the motor isn't receiving sufficient current, possibly due to a blown fuse or a bad connection. The start capacitor is relevant mainly for single-phase motors, so in a three-phase system, a fuse issue is a common culprit.

Mechanical Maintenance

Q: During routine inspection, you find a belt showing signs of fraying and cracking. What is the recommended course of action?

- a) Continue operation until the belt fails
- b) Adjust the tension to compensate for wear
- c) Replace the belt immediately
- d) Lubricate the belt to extend its life

A: c) Replace the belt immediately

Explanation: Fraying and cracking indicate significant wear and potential failure, which could cause equipment downtime or damage. Replacing the belt promptly ensures safe and reliable operation.

Safety Procedures

Q: When performing maintenance on a live electrical panel, which PPE is mandatory?

- a) Safety glasses
- b) Insulated gloves
- c) Flame-resistant clothing
- d) All of the above

A: d) All of the above

Explanation: Working on live electrical panels requires comprehensive PPE, including insulating gloves,

safety glasses, and flame-resistant clothing, to protect against electrical shock, arc flash, and other hazards.

maintenance technician test questions and answers: Machine Gun Manuals Combined: MAINTENANCE OF THE M2, M242 AND M249 MACHINEGUNS, 2019-03-14 Introduction The M2 caliber .50 machinegun supports the infantryman in both the attack and defense. It provides the rifleman with the heavy volume of close, accurate, and continuous fire necessary to accomplish his mission in the attack. The long range, close defensive, and final protective fires delivered by this weapon form an integral part of the unit's defensive fires. The M2 caliber .50 machinegun is also used to provide protection for motor movements, vehicle parks, and train bivouacs. It is also used to defend against low-flying hostile aircraft and to destroy lightly armored vehicles. In addition, it is used for reconnaissance by fire on suspected enemy positions. The M242 automatic machinegun is a 25mm gun found on the turret of the infantry and cavalry fighting vehicles. This weapon can be installed or removed in three assembly parts: barrel, feeder, and receiver. The machinegun has both electrical and manual fire control and it is externally powered. It also has a dual feed capability and 25mm ammunition cans that contain 70 rounds of armor piercing (AP), and 230 rounds of high explosive (HE) ammunition. The weapon can also fire single shots of 100 rounds per minute (low rate), or 200 rounds per minute (high rate). The M249 machinegun is designed as a fire team automatic weapon to be used for rear area security and special missions. The machinegun is gas operated, air-cooled, and fires from the open bolt position. It has a regulator for selecting normal or maximum (max) rate of fire. Use of the max rate is authorized only in the event that the weapon's firing rate slows down, otherwise stated: the weapon becomes sluggish. It also has an alternative 30 round magazine feeding provision. The use of the 30 round magazine is authorized only in an emergency situation since the use of the magazine reduces the performance of the machinegun.
