tropicau: Viral Infections and Global Change Sunit Kumar Singh, 2013-10-10 A timely exploration of the impact of global change on the emergence, reemergence, and control of vector-borne and zoonotic viral infections From massively destructive superstorms to rapidly rising sea levels, the world media is abuzz with talk of the threats to civilization posed by global warming. But one hazard that is rarely discussed is the dramatic rise in the number and magnitude of tropical virus outbreaks among human populations. One need only consider recent developments, such as the spread of chikungunya across southern Europe and dengue in Singapore, Brazil, and the southern United States, to appreciate the seriousness of that threat. Representing a major addition to the world literature on the subject, Viral Infections and Global Change explores trends of paramount concern globally, regarding the emergence and reemergence of vector-borne and zoonotic viruses. It also provides up-to-date coverage of both the clinical aspects and basic science behind an array of specific emerging and reemerging infections, including everything from West Nile fever and Rift Valley fever to zoonotic hepatitis E and human bunyavirus. Important topics covered include: Epidemiology, molecular pathogenesis, and evolutionary mechanisms Host-pathogen interactions in an array of viral infections The impact of climate change on historical viral outbreaks The roles of socioeconomics, human behavior, and animal and human migrations The growing prevalence of drug and pesticide resistance The introduction of microbes and vectors through increased transboundary travel Spillover transmissions and the emergence of viral outbreaks Detecting and responding to threats from bioterrorism and emerging viral infections Predictive modeling for emerging viral infections Viral Infections and Global Change is an indispensable resource for research scientists, epidemiologists, and medical and veterinary students working in ecology, environmental management, climatology, neurovirology, virology, and infectious disease.

tropicau: *The Biosaline Concept* Alexander Hollaender, 2012-12-06 There are many areas on this world which might lend themselves to agricultural development and which are, at the present,

not used for this purpose. Two of the most obvious are desert areas where the salt concentration is very high, both land and water areas. With the development of new approaches and careful research, considerably more productive capability could be developed in these. This volume points out some of the possible approaches as well as results obtained by a combination of creative research, practical understanding of the problems involved and inventive ways to overcome some of the handicaps of utilizing biosaline areas. This volume grew out of the International Workshop on Biosaline Research organized by Mr. Gilbert Devey of the Division of International programs of the National Science Foundation and directed by Dr. Anthony San Pietro of the Department of Biology of Indiana University. Since the proceedings of the workshop appeared somewhat limited, it was thought to broaden the spectra of chapters and include several topics briefly discussed at the Kiawah workshop.

The second half of the book looks at the classification system for cave systems and the influence of climate and climatic change on karst development. The book ends with chapters on karst water resource management and a look at the important issues of environmental management, including environmental impact assessment, environmental rehabilitation, tourism impacts and conservation values. Practical application of karst studies are explained throughout the text. This new edition strengthens the book's position as the essential reference in the field. tropicauc: China's Foreign Aid and Investment Diplomacy, Volume III John F. Copper, 2016-04-29 Today, by many accounts, China is the world's foremost purveyor of foreign aid and foreign investment to developing countries. This is the product of China's miracle economic growth over a period of more than three decades, together with China's drive to become a major player in world affairs and accomplish this through economic rather than military means. This three-volume work is the first comprehensive study of China's aid and investment strategy to trace how it has evolved since Beijing launched its foreign aid diplomacy at the time of the founding of the People's Republic of China in 1949. Volume III offers an analysis of China's foreign aid and investment to countries outside of Asia: in Africa, Europe, the Middle East, Latin America, and Oceania. Africa was and is the most important of these regions and it is given special treatment. In the concluding chapter, Copper reviews the findings of previous the volumes, delineates China's most important victories and setbacks, and notes opposition to and criticism of China's aid and investment diplomacy. Copper gives evidence that will be shocking to some of the reality that China's financial help to developing countries is one of the most salient trends in international politics and constitutes a formidable challenge to the United States, Japan, and Europe, as well as international financial institutions.

A more sophisticated example could be a highly selective surface permeability allowing passive diffusion and selective transport of molecules in the water or gases. The smart surface technology provides an interlayer model which prevents the entry of substances without affecting the properties of neighboring layers. A number of methods have been developed for coatings, which are essential building blocks for the top-down and/or bottom-up design of numerous functional materials. Advanced Surface Engineering Materials offers a detailed up-to-date review chapters on the functional coatings and adhesives, engineering of nanosurfaces, high-tech surface, characterization and new applications. The 13 chapters in this book are divided into 3 parts (Functional coatings and adhesives; Engineering of nanosurfaces; High-tech surface, characterization and new applications) and are all written by worldwide subject matter specialists. The book is written for readers from diverse backgrounds across chemistry, physics, materials science and engineering, medical science, environmental, bio- and nano- technologies and biomedical engineering.
