Finding the Laurent series of $f(z) = 1/(z-1)(z-2)$ I assume you want the Laurent series expansion for this function at 0 (since this is the point those annuli are centered at). The standard way to do this is not to use the integral

If f has pole at 0 then show that e^f can't have pole at 0 . Since $\exp(S_R) = \mathbb{C} \setminus \{0\}$, we see that e^f takes all nonzero complex values on a deleted neighbourhood of 0 . Thus the singularity of e^f at 0 must be

real analysis - Convergence of sequence of functions $\{f_n\}$ to f Also, $\|f_n - f\|_p$ is usually referred to convergence of norm which deals with the convergence of the sequence of norms $\|f_n - f\|_p$, $n \geq 1$, whereas

algorithms - Prove if $f(n) = O(g(n))$, $f(n) + g(n) = \Omega(g(n))$ If $f(n)$ and $g(n)$ are non-negative functions such that $f(n) = O(g(n))$ there must be positive constants c and n_0 such that $0 \leq f(n) \leq c(g(n))$ for all $n \geq n_0$

complex analysis - If f has a pole of order m at z_0 find the Laurent series Actually, when you Laurent expand f around z_0 , the negative coefficient c_{-m} will be non-zero, but all coefficients of terms less than $-m$ will all be zero. When you differentiate this
