algebra readiness test: Reaching Algebra Readiness (RAR) Tony G. Williams, 2011-01-01

Research has shown that algebra is the doorway and gateway for future success of students in many aspects, including high school graduation, attending and success in college, and professional earning power. And the most important key to students' success in algebra is their readiness. This book is not only a program that addresses algebra readiness; it is also a fundamental reform effort, based on the National Mathematics Advisory Panel's (NMAP's) Final Report (spring, 2008). The book approaches mathematic skills deficiencies on an individual basis, much like an IEP addresses the individual needs of a student with disabilities. The Reaching Algebra Readiness (RAR) process consists of four components: (1) Diagnostic, assessing student's mastery of the skills needed to take algebra; (2) Prescriptive, developing an individualized plan to address specific math deficiencies; (3) Intervention, utilizing tools and resources (parental involvement, effective teaching strategies, etc), to improve students' mathematics skills; and (4) Drills and Effective Teachings Strategies, mathematics is a discipline and, simply, there is no way of avoiding practice and drilling in reaching algebra readiness, which can be enhanced significantly by implementing proven effective teaching strategies. The Reaching Algebra Readiness (RAR) process and the related materials presented in this book will be revolutionary in helping all students acquire the math skills needed for success in algebra and beyond.

algebra readiness test: Opportunity to Learn, Curriculum Alignment and Test Preparation Jaap Scheerens, 2016-08-30 This book provides a review of the effectiveness of Opportunity to Learn (OTL) operationalized as the association between OTL and student achievement. In addition, it presents an elaborate conceptual map in which OTL is regarded as part of a larger concept of curriculum alignment. Major components of this framework are national goals and standards, school curricula, formative tests, textbooks, actual delivery of content as part of teaching, and summative tests and examinations. Alignment between educational goals, intended and implemented curricula, and educational outcomes is considered an important prerequisite for effective education. The expectation is that better alignment leads to better student performance. The concept of OTL is commonly used to compare content covered, as part of the implemented curriculum, with student achievement. As such it is to be seen as a facet of the broader concept of "alignment". As it comes to enhancing OTL in educational policy and practice, proactive curriculum development is compared to a more retroactive orientation. Legitimate forms of test and examination preparation belong to this retroactive orientation, and are seen as favorable conditions for optimizing OTL. This book reviews the research evidence on the effects of OTL on student achievement by means of detailed descriptions of key-empirical studies, a review of meta-analyses, a "vote count" syntheses of 51 empirical studies, conducted between 1995 and 2015, and a secondary analysis based on TIMSS 2011, and PISA 2012 data. It concludes that the effect size of OTL, at about .30, is modest, but comparable in size to other effectiveness-enhancing conditions in schooling. The final chapter of the book provides suggestions for educational policy and practice to further optimize OTL. /div

algebra readiness test: Mathematicians and Education Reform, 1989-1990 Naomi Fisher, Harvey Keynes, Philip Wagreich, 1991 Educational issues are receiving a great deal of attention in the mathematical sciences community, as concern rises over the quality of instruction in the nation's schools, colleges, and universities. Insuring a mathematically literate population and increasing the number of students pursuing careers in mathematics, science and engineering are high on the list of priorities. Mathematicians can make important contributions to the educational reform process. The present volume is the second in the series Issues in Mathematics Education, launched in 1990 by the Conference Board of the Mathematical Sciences and published by the AMS and the Mathematical Association of America. The purpose of the series is to stimulate the flow of information among mathematical scientists, education specialists, and teachers, about innovative efforts to revitalize mathematics education. Compiled and edited by the directors of the Mathematicians and Education Reform (MER) Network, this book contains papers by speakers and participants in MER workshops and special sessions over the last three years. Like the first volume, which also grew out of an MER workshop, this book is organized into two sections, Projects and Issues and Reactions, providing a balance between descriptions of successful existing projects and more in-depth discussion of problems and issues in mathematics education reform. With contributions by some of the major leaders in this area today, this book will likely be of interest to a broad segment of the mathematical sciences community.
