ncvt result: The Standing of Vocational Education and the Occupations It Serves Stephen Billett, Barbara Elisabeth Stalder, Vibe Aarkrog, Sarojni Choy, Steven Hodge, Anh Hai Le, 2022-04-21 This book addresses what is, perhaps, the single most important issue for vocational education; its relatively low standing in an era of high aspiration. The work explores the nature, extent and consequences for an educational sector that whilst having an increasingly important role in contemporary societies is seen to be of low standing across both countries with developed and developing economies. Some of the standing is associated with the occupation it serves and this is highlighted in an era of high aspiration by young people and their parents. The consequences are far-reaching. This includes how governments and community view and support vocational education, parents and familiars advise about participation in it and young people's decision-making associated with their post-school pathways. More than describing this problem, the focus of this collection is how this issue can be redressed through the actions of supra-government agencies, governments, schools in tertiary education institutions, industry and professional bodies and employers. It sets out the quality and extent of societal sentiments in shaping how vocational education and the occupation it serves are projected, across countries, continents and cultures, and offers a range of perspectives and contributions from scholars on how this issue might be redressed. These contributions are drawn together and synthesised into sets of propositions, practices and approaches directed towards governments, schooling and tertiary education institutions, educators, researchers, industry and professional bodies and employers. In this way, the book seeks to provide an authoritative, seminal, comprehensive and central text to understand and respond to this central issue for vocational education.

ncvt result: *Vehicle Propulsion Systems* Lino Guzzella, Antonio Sciarretta, 2007-09-21 In this book the longitudinal behavior of road vehicles is analyzed. The main emphasis is on the analysis and minimization of the fuel and energy consumption. Most approaches to this problem enhance the complexity of the vehicle system by adding components such as electrical motors or storage devices. Such a complex system can only be designed by means of mathematical models. This text gives an introduction to the modeling and optimization problems typically encountered when designing new propulsion systems for passenger cars. It is intended for persons interested in the analysis and optimization of classical and novel vehicle propulsion systems. Its focus lies on the control-oriented mathematical description of the physical processes and on the model-based optimization of the system structure and of the supervisory control algorithms. This text has evolved from a lecture series at ETH Zurich. Prerequisites are general engineering topics and a first course in optimal control theory.

It introduces the ideas of classical thermodynamics and explores them both in general and as they are applied to specific processes and interactions. The remainder of the book deals with statistical mechanics. Each topic ends with a boxed summary of ideas and results, and every chapter contains numerous homework problems, covering a broad range of difficulties. Answers are given to odd-numbered problems, and solutions to even-numbered problems are available to instructors at www.cambridge.org/9781107694927.
