nss 1a: Bayesian Methods for Structural Dynamics and Civil Engineering Ka-Veng Yuen, 2010-02-22 Bayesian methods are a powerful tool in many areas of science and engineering, especially statistical physics, medical sciences, electrical engineering, and information sciences. They are also ideal for civil engineering applications, given the numerous types of modeling and parametric uncertainty in civil engineering problems. For example, earthquake ground motion cannot be predetermined at the structural design stage. Complete wind pressure profiles are difficult to measure under operating conditions. Material properties can be difficult to determine to a very precise level – especially concrete, rock, and soil. For air quality prediction, it is difficult to measure the hourly/daily pollutants generated by cars and factories within the area of concern. It is also difficult to obtain the updated air quality information of the surrounding cities. Furthermore, the meteorological conditions of the day for prediction are also uncertain. These are just some of the civil engineering examples to which Bayesian probabilistic methods are applicable. Familiarizes readers with the latest developments in the field Includes identification problems for both dynamic and static systems Addresses challenging civil engineering problems such as modal/model updating Presents methods applicable to mechanical and aerospace engineering Gives engineers and engineering students a concrete sense of implementation Covers real-world case studies in civil engineering and beyond, such as: structural health monitoring seismic attenuation finite-element model updating hydraulic jump artificial neural network for damage detection air quality prediction Includes other insightful daily-life examples Companion website with MATLAB code downloads for independent practice Written by a leading expert in the use of Bayesian methods for civil engineering problems This book is ideal for researchers and graduate students in civil and mechanical engineering or applied probability and statistics. nss 1a: Acidic Deposition and Aquatic Ecosystems Susan Christie, Donald F. Charles, 2013-04-17 Acidic deposition and its effect on aquatic ecosystems have become major scientific and public policy issues in the United States since the early 1970s, and many diverse studies have been completed. This book is the first comprehensive, integrated synthesis of available information on current and potential effects of acidic precipitation on lakes and streams in geographic regions with a high number of low-alkalinity surface water from the Adirondacks and the Southern Blue Ridge to the Upper Midwest to the Rocky Mountains, the Sierra Nevada, and the Cascades. Written by leading authors, the book examines the current status of water chemistry and characterizes the processes controlling water chemistry on a regional basis by using and comparing high-quality data sets. Methods for the assessment of long-term changes in water chemistry and their effects in fish and other biota are also presented. The book amply illustrates the substantial diversity among geographical regions with respect to the nature of surface waters and the complexity of their response to acidic deposition. This volume will be of great interest to researchers in limnology, aquatic ecology, environmental chemistry, hydrology, and atmospheric sciences. It will also serve as an important reference for environmental managers and policy makers.

nss 1a: Dawn of the Algorithm Yann Rousselot, 2015-05-30 Dawn of the Algorithm, Yann Rousselot's debut collection of poetry, is a bestiary of octosharks and dinosaurs, zombies and pathogens, mecha robots and common mortals. These monsters were raised on a diet of TV tropes, movie clichés, book snippets, and video game storylines. Some have beating hearts, others interlocking mechanical parts. They are forces of human nature, genetically engineered with a single purpose: to herald the apocalypse. Building on user-friendly motif and imagery, Rousselot draws acute, playful but painful conclusions about twenty-first century Earth. He paints a darkly comical portrait of humankind, a species plagued by heartbreak and alienation, yet driven by hope and, at

the very core, a burning desire to connect. nss 1a: Null Subjects in Slavic and Finno-Ugric Gréte Dalmi, Egor Tsedryk, Piotr Cegłowski, 2022-01-19 Even though null subjects have been extensively studied in the past four decades, there is a growing interest in partial null subject languages (e.g. Finnish) and a subtler classification of null subject phenomena overall. This volume aims at contributing to this trend, focusing on Slavic and Finno-Ugric groups, with some extension to Baltic and Samoyedic languages. Interestingly, these groups offer an impressive array of macro- and microvariation. Moreover, given an increasing interest towards the internal structure of the pronominal elements and the role of various types of topics in the left periphery of the sentence structure, the enterprise taken up in this book is to investigate lexical and null, referential and generic subjects in order to understand and compare their feature composition, licensing conditions, and structural properties. Rather than trying to squeeze the studied languages into a predefined set of parameters, this volume highlights some properties that may lead to a refinement of the existing generalizations. It brings together contributors from both generative and typological traditions and will be of interest to any researcher willing to investigate argument-drop in a wider crosslinguistic perspective.
