sample of ds 260 form: Attachment Assessment in treatments, prevention and intervention programs Silvia Salcuni, 2015-05-13 Attachment theory, assessment and research offers a broad, far-reaching view of human functioning, and it can enrich a psychologist's understanding of subjects and their relational adjustment, both in clinical and non-clinical settings. Ongoing research in attachment has led to a number of individual treatments and prevention and intervention programs. The assessment of an individual's attachment organization, can play a crucial role in explaining and previewing the unfolding treatment, the relational adjustments or concerns, and the psychological well-being. We hope to receive empirical papers that give evidence for the usefulness of attachment assessment in both clinical (e.g., patients with Eating Disorder; or Axis-II; psychotherapy patients...) or not clinical population (e.g. Adoptive and/or foster families or couples, Mother-infant assessment in prevention field...). These papers should include methodological issues and information about the participants, the methods used to assess attachment, the process of scorer training and the availability of the manual used to obtain inter-scorer reliability. Case studies may be of interest to the extent that they demonstrate the value of a systematic approach to attachment material. A range of theoretical perspectives is welcome as well presentation of new emergent tools on attachment. Because *Frontiers in Psychology* is an international journal, each empirical paper should comment on the international implications of the findings and discuss its cross-cultural use. Such comments may include, for example, its linguistic specificity, its robustness in translation, and the cross-cultural generalizability of the constructs and behaviors of the measure and its usual correlates. Cross-cultural generalizability is not, however, a requirement.

sample of ds 260 form: The Role of Physical and Biological Gut Barriers in Modulating Crosstalk between the Microbiota and the Immune System Marika Falcone, Federica Facciotti , Julien Diana, 2024-07-29 The intestine has several means for maintaining immune homeostasis and for avoiding inflammation despite massive antigenic stimulation by food components and by commensal bacteria residing in the gut mucosa. These mechanisms include physical and biological barriers such as (i) the intestinal epithelial barrier (IEB); (ii) the gut vascular barrier (GVB) and (iii) the mucus layer. In particular, the mucus layer does not simply act as a diffusion barrier but has important dynamic functions that regulate the type of commensal bacteria residing in the inner mucus layer, enabling the passage of food and bacterial products into the gut tissue and systemic circulation. Importantly, the mucosal layer also has key immune regulatory functions. A healthy mucus structure is fundamental for promoting the presence of beneficial commensal bacteria, such as the short-chain fatty acids (SCFA)-producing bacteria which are known to promote immune tolerance. Moreover, the mucus layer contains anti-microbial peptides (AMPs) and mucins that have key immune modulatory functions. The integrated response of these combined defense systems is fundamental for containing microbes and their products within the intestine; for avoiding their systemic spread and for suppressing their capacity to activate systemic immune and autoimmune responses.
