A. Lennon, 2011-09-28 It is a pleasure and an honor to write a foreword for Jennifer Lennon's book *Hypermedia Systems and Applications: World Wide Web and Beyond*. I am fortunate to have been able to follow the development of this book from an excellent Ph.D. thesis to what I would consider one of the best and most comprehensive books in the area. It has a good chance to become a must for teachers, researchers, and practitioners. For the sake of this foreword let us combine the phenomena hypermedia, the Internet, and the WWW by just calling them the Web. Well, this Web surely has become one of the super hot topics, from both a scholarly and a commercial point of view! We have a saying that the Web is like a dog: one year's development of the Web corresponds to seven human years. You will be familiar with Murphy's law: Anything that can go wrong will go wrong, and with a plethora of derivatives or specializations thereof like: If you are in an otherwise empty locker room, the only other person there is bound to have a locker just on top of yours; or: If traffic is moving slowly, you are always going to be in the slowest moving lane, and so on. Well, I have coined a version that applies to the Web: Whenever you have understood an important new development concerning the Web you can be sure that it is obsolete.

Trigg present a set of principles for the design of open hypermedia systems and provide concrete implications of these principles for issues ranging from data structures to architectures and system integration, and for settings as diverse as the World Wide Web and the workplace. In this book Kaj Grønþæk and Randall H. Trigg present a set of principles for the design of open hypermedia systems and provide concrete implications of these principles for issues ranging from data structures to architectures and system integration, and for settings as diverse as the World Wide Web and the workplace. The principles, which cover both hypermedia system processing and data structures, reflect results from decades of hypermedia research, including the popular Dexter hypertext reference model and the authors own extended object-oriented version of the Dexter model. One important principle is the notion of links as first-class objects outside the data. Emerging systems such as HyperWave, Microcosm, and Devise Hypermedia apply this principle to extend the capabilities of the Web. The authors also discuss the management of incomplete and dangling links, time-based media including video and sound, support for collaboration and shared hypermedia structures, worldwide distribution, and integration of third-party applications in open hypermedia systems.

hypermedia systems book pdf free download: *Designing Hypermedia for Learning* David H. Jonassen, Heinz Mandl, 2012-12-06 This most unusual book results from the NATO Advanced Research Work shop, *Designing Hypertext/Hypermedia for Learning*, held in Rottenburg am Neckar, FRO, from July 3-8, 1989. The idea for the workshop resulted from the burgeoning interest in hypertext combined with the frustrating lack of literature on learning applications for hypertext. There was little evidence in 1988 that hypertext could successfully support learning out comes. A

few projects were investigating hypertext for learning, but few conclusions were available and little if any advice on how to design hyper text for learning applications was available. Could hypertext support learning objectives? What mental processing requirements are unique to learning outcomes? How would the processing requirements of learning outcomes interact with unique user processing requirements of browsing and constructing hypertext? Should hypertext information bases be restructured to accommodate learning outcomes? Should the user interface be manipulated in order to support the task functionality of learning outcomes? Does the hypertext structure reflect the intellectual requirements of learning outcomes? What kinds of learning-oriented hypertext systems were being developed and what kinds of assumptions were these systems making? These and other questions demonstrated the need for this workshop. The workshop included presentations, hardware demonstrations, sharing and browsing of hypertexts, and much discussion about all of the above. These were the experiences that you, the reader of this book, unfortunately did not experience.

hypermedia systems book pdf free download: Hypermedia and Literary Studies Paul Delany, George P. Landow, 1991 The essays in *Hypermedia and Literary Studies* discuss the theoretical and practical opportunities and challenges posed by the convergence of hypermedia systems and traditional written texts. Consider a work from Shakespeare. Imagine, as you read it, being able to call up instantly the Elizabethan usage of a particular word, variant texts for any part of the work, critical commentary, historically relevant facts, or oral interpretations by different sets of actors. This is the sort of richly interconnected, immediately accessible literary universe that can be created by hypertext (electronically linked texts) and hypermedia (the extension of linkages to visual and aural material). The essays in *Hypermedia and Literary Studies* discuss the theoretical and practical opportunities and challenges posed by the convergence of hypermedia systems and traditional written texts. They range from the theory and design of literary hypermedia to reports of actual hypermedia projects from secondary school to university and from educational and scholarly to creative applications in poetry and fiction.
