

interpreting graphics - taxonomy

interpreting graphics - taxonomy is a foundational concept in data visualization and information analysis. It involves systematically categorizing different types of visual representations to enhance understanding, improve communication, and facilitate accurate interpretation of data. Understanding the taxonomy of graphics enables analysts, educators, students, and professionals to select the most appropriate visual tools for their specific needs, interpret them correctly, and avoid misrepresentations that can lead to faulty conclusions. This article explores the comprehensive taxonomy of interpreting graphics, highlighting various types, their characteristics, appropriate use cases, and best practices for accurate interpretation.

Understanding the Importance of Interpreting Graphics

Graphics, charts, and visual data representations are integral to conveying complex information succinctly. They transform raw data into visual formats that are easier to grasp, especially when dealing with large datasets or multifaceted information.

Why Proper Interpretation Matters

- Prevents Misunderstanding: Misreading graphics can lead to incorrect conclusions.
- Enhances Communication: Clear interpretation ensures the message is accurately conveyed.
- Supports Decision-Making: Reliable understanding of visual data aids strategic choices.
- Facilitates Learning: Proper interpretation improves data literacy skills.

Taxonomy of Graphics: An Overview

The taxonomy of graphics refers to the classification system that organizes visual representations based on their form, purpose, and data type. It helps users identify, select, and interpret visuals effectively.

Categories of Graphics in Data Interpretation

The main categories include:

- Statistical Graphics: Designed to display statistical data and relationships.
- Process and Hierarchy Graphics: Show workflows, hierarchies, or processes.
- Geographical Graphics: Depict spatial or geographical data.
- Temporal Graphics: Illustrate data over time.

- Composite Graphics: Combine multiple visualization types for complex data.

Types of Graphics in Data Interpretation

Understanding the specific types within each category is essential for accurate data interpretation. Below is a detailed taxonomy of common graphics.

Statistical Graphics

Statistical graphics are used to represent quantitative data, reveal patterns, and identify relationships.

Common Types include:

1. Bar Charts

- Purpose: Compare quantities across categories.
- Characteristics: Rectangles with lengths proportional to values.
- Best Use: Categorical comparisons, frequency distributions.

2. Histograms

- Purpose: Show data distribution.
- Characteristics: Similar to bar charts but used for continuous data grouped into bins.
- Best Use: Understanding data spread and skewness.

3. Pie Charts

- Purpose: Display parts of a whole.
- Characteristics: Circular charts divided into slices.
- Best Use: Showing proportional data; limited slices for clarity.

4. Line Graphs

- Purpose: Show trends over time or ordered categories.
- Characteristics: Points connected by lines.
- Best Use: Tracking changes, temporal patterns.

5. Scatter Plots

- Purpose: Examine relationships between two variables.
- Characteristics: Points plotted in two-dimensional space.
- Best Use: Correlation analysis, identifying outliers.

6. Box Plots

- Purpose: Summarize data distributions.
- Characteristics: Display median, quartiles, and outliers.
- Best Use: Comparing distributions across groups.

Key Points for Interpreting Statistical Graphics:

- Identify the type of chart and its purpose.
- Read axis labels and units carefully.
- Note scales and intervals.
- Look for patterns, trends, outliers, and anomalies.
- Be cautious of misleading visual elements like unequal axis scales.

Process and Hierarchy Graphics

These visuals illustrate workflows, procedures, or structural relationships.

Types include:

1. Flowcharts

- Show sequential steps in a process.

2. Organizational Charts

- Depict hierarchical relationships within organizations.

3. Sankey Diagrams

- Visualize flow quantities between nodes.

4. Mind Maps

- Capture ideas and their relationships.

Interpretation Tips:

- Follow the flow direction.
- Understand symbols and connectors.
- Recognize levels of hierarchy.
- Identify key decision points or flow paths.

Geographical Graphics

These visuals are used to interpret spatial data.

Types include:

1. Choropleth Maps

- Color-coded regions based on data values.

2. Proportional Symbol Maps

- Use symbols of varying sizes to represent data.

3. Heat Maps

- Show intensity or concentration areas.

4. Topographic Maps

- Display terrain and elevation.

Interpreting Geographical Graphics:

- Pay attention to color scales and legends.
- Understand geographic boundaries.
- Recognize spatial clustering or dispersion.
- Be aware of projection distortions.

Temporal Graphics

These graphics represent data over time.

Types include:

1. Line Graphs
2. Area Charts
3. Timeline Charts
4. Animated Visualizations

Tips for interpretation:

- Focus on trends, cycles, and anomalies.
- Note time intervals and units.
- Observe seasonal patterns or irregularities.

Composite Graphics

Combine multiple visualization types for complex insights.

Examples:

- Dashboard with charts, maps, and gauges.
- Multi-layered visuals integrating statistical and geographical data.

Interpretation Practice:

- Understand how components relate.

- Avoid cognitive overload by focusing on key elements.
- Cross-reference data points for comprehensive insights.

Best Practices for Interpreting Graphics

To accurately interpret graphics, consider the following guidelines:

1. **Understand the Context:** Know the purpose of the graphic and the data it presents.
2. **Examine Labels and Legends:** Clarify what axes, colors, symbols, and scales represent.
3. **Assess Data Scales and Axes:** Check for manipulative axis scales that may distort perceptions.
4. **Identify Data Sources and Limitations:** Recognize potential biases or data inaccuracies.
5. **Look for Patterns and Trends:** Focus on consistent movements or relationships.
6. **Detect Outliers and Anomalies:** Notice data points that deviate significantly from others.
7. **Avoid Confirmation Bias:** Interpret graphics objectively, resisting preconceived notions.
8. **Compare Multiple Graphics:** Use different visualizations to verify insights.
9. **Seek Clarity and Simplicity:** Favor visuals that communicate effectively without unnecessary complexity.

Common Pitfalls in Interpreting Graphics and How to Avoid Them

Misinterpretation can lead to erroneous conclusions. Be aware of common pitfalls:

- **Misleading Scales:** Manipulating axes to exaggerate or minimize differences.

- Overuse of Pie Charts: Difficult to compare slices accurately, especially with many segments.
- Ignoring Context: Taking data out of context can distort meaning.
- Overloading Visuals: Excessive information can confuse rather than clarify.
- Assuming Causation: Correlation does not imply causation; interpret relationships carefully.
- Ignoring Data Gaps: Missing data or gaps can mislead analysis.

Strategies to Avoid Pitfalls:

- Always scrutinize axes and scales.
- Use complementary graphics for validation.
- Maintain skepticism and verify with raw data when in doubt.
- Educate oneself on best practices in data visualization.

Conclusion: Mastering the Taxonomy of Graphics for Better Data Literacy

Interpreting graphics effectively requires a solid understanding of the taxonomy of visual data representations. Recognizing the different types—statistical, process, geographical, temporal, and composite—enables users to select the right visual tools and interpret them accurately. By applying best practices and being aware of common pitfalls, individuals can significantly improve their data literacy, make informed decisions, and communicate insights clearly. As data continues to grow in complexity and volume, mastering the taxonomy of graphics becomes an essential skill in today's information-driven world.

Remember: The key to effective interpretation lies not just in viewing visuals but in critically analyzing their structure, content, and context. With a comprehensive understanding of the taxonomy of graphics, you can unlock the full potential of visual data and become a proficient data interpreter.

Frequently Asked Questions

What are the key categories in the taxonomy of interpreting graphics?

The key categories include static vs. dynamic graphics, quantitative vs. qualitative data representations, and the method of interpretation such as visual analysis, contextual understanding, and comparative evaluation.

How does understanding the taxonomy of graphics improve data

interpretation skills?

It provides a structured framework to identify the type of graphic, recognize its purpose, and apply appropriate analytical techniques, leading to more accurate and insightful interpretations.

What role does visual hierarchy play in interpreting different types of graphics?

Visual hierarchy guides viewers in focusing on the most important elements first, aiding efficient interpretation by emphasizing key data points or trends within various graphic types.

How can recognizing the classification of a graphic assist in critical analysis?

Recognizing whether a graphic is, for example, a bar chart or a scatter plot, helps determine the best approach to analyze data relationships, identify patterns, and avoid misinterpretation.

What are common challenges when interpreting complex graphics, and how does taxonomy help address them?

Challenges include data overload and misreading visual cues. Taxonomy helps by categorizing graphics, enabling analysts to select suitable methods for simplification and accurate interpretation.

In what ways does the taxonomy of graphics influence data visualization best practices?

It informs best practices by clarifying which graphic types are most effective for certain data types and messages, promoting clarity, accuracy, and audience engagement.

Why is it important to understand the limitations of different graphic types in interpretation?

Understanding limitations prevents misinterpretation due to misleading visuals or inappropriate graphic choices, ensuring more reliable and truthful data communication.

Interpreting Graphics - Taxonomy: A Comprehensive Analysis for Effective Visual Literacy

In the digital age, data visualization has become an indispensable tool across disciplines ranging from

scientific research and business analytics to journalism and education. As the volume and complexity of data proliferate, the ability to interpret graphics accurately and efficiently has emerged as a vital skill. At the core of mastering this skill lies the concept of interpreting graphics - taxonomy, a systematic framework that categorizes visual representations based on their design, purpose, and interpretative strategies. This article embarks on an in-depth exploration of the taxonomy of graphics, examining its significance, foundational principles, classifications, and practical applications in enhancing visual literacy.

The Significance of a Taxonomy in Interpreting Graphics

Understanding the taxonomy of graphics is essential for multiple reasons:

- Enhancing Comprehension: Recognizing different types of graphics allows viewers to apply appropriate interpretative strategies, leading to more accurate understanding.
- Facilitating Communication: Clear categorization helps creators design visuals aligned with their communicative intent, and viewers decode messages effectively.
- Improving Critical Evaluation: A taxonomy provides a framework for assessing the quality, appropriateness, and potential biases within graphics.
- Supporting Education and Training: Structured knowledge assists educators in teaching visual literacy systematically.

In essence, a well-defined taxonomy acts as a cognitive map, guiding users through the complex landscape of visual data representation.

Foundations of Graphics Taxonomy

The taxonomy of graphics is rooted in several theoretical and practical considerations:

- Purpose of Visualization: Whether to describe, compare, explain, or predict influences the choice of graphic.
- Data Type: Quantitative, categorical, or spatial data necessitate different visual formats.
- Design Elements: Use of axes, symbols, colors, and spatial arrangements impacts interpretability.
- Cognitive Load: Simpler graphics reduce cognitive load, while complex visuals require more sophisticated interpretive strategies.

Building on these foundations, researchers and practitioners have proposed various classification schemes,

which focus on different aspects of graphics.

A Taxonomy Framework for Graphics

A comprehensive taxonomy can be structured around key dimensions:

- Type of Graphic
- Purpose of Visualization
- Data Representation Mode
- Interaction Level

These dimensions help in systematically categorizing graphics and understanding their interpretive approaches.

Type of Graphic

This classification is fundamental and includes the following categories:

1. Statistical Graphics

Visuals that display data distributions, relationships, or trends. Examples include:

- Bar charts
- Histograms
- Scatter plots
- Box plots
- Line graphs

2. Geospatial Maps

Visuals representing spatial data, such as:

- Choropleth maps
- Dot density maps
- Topographic maps
- Spatial heatmaps

3. Hierarchical and Network Graphics

Visuals depicting structures, relationships, or hierarchies:

- Tree diagrams
- Network graphs
- Flowcharts
- Sankey diagrams

4. Visualizations of Text and Categorical Data

Visuals that encode categorical or qualitative data:

- Pie charts
- Mosaic plots
- Word clouds

5. Temporal and Sequential Visuals

Visuals emphasizing change over time:

- Timeline charts
- Gantt charts
- Animations and interactive timelines

Purpose of Visualization

The interpretive approach varies depending on the goal:

- Descriptive: Summarize data (e.g., histograms, bar charts)
- Comparative: Highlight differences or similarities (e.g., side-by-side bar charts)
- Explanatory: Reveal relationships or causality (e.g., scatter plots with trend lines)
- Predictive: Support forecasts (e.g., trend lines, forecast charts)
- Exploratory: Enable users to discover patterns (interactive dashboards)

Recognizing the purpose guides the viewer on which interpretive strategies to employ.

Data Representation Mode

Graphics can encode data through different modes:

- Quantitative Encoding: Using length, position, or size (e.g., bar length, point position)
- Qualitative Encoding: Using color, shape, or pattern (e.g., categorical coloring)
- Spatial Encoding: Representing data within a spatial context (e.g., maps)

Understanding the mode of representation informs the interpretive focus and potential pitfalls.

Interaction Level

Graphics can be static or dynamic:

- Static Graphics: Fixed images requiring interpretation without user interaction.
- Interactive Graphics: Enable user engagement through zooming, filtering, or hovering, enhancing exploratory analysis.

This dimension influences how viewers interpret and extract information.

Mapping the Taxonomy: Practical Classifications and Examples

Building on the framework above, several practical classification schemes have been proposed by scholars:

1. Shneiderman's Visual Information-Seeking Mantra

- Overview → Zoom & Filter → Details-on-Demand

This emphasizes a layered approach, where graphics serve different interpretive levels.

2. Few's Data-Ink Ratio and Minimalism

- Prioritizing clarity by reducing unnecessary visual elements to facilitate straightforward interpretation.

3. Cleveland and McGill's Graphical Perception Taxonomy

- Focuses on the accuracy of interpreting visual encodings like position, length, angle, and color saturation.

4. The Data-Context-Design (D-C-D) Model

- Categorizes graphics based on their context, data type, and design considerations.

Common Graphic Types and Their Interpretive Strategies

This section provides a detailed look at prevalent graphics, their typical use cases, and interpretive considerations.

Bar Charts and Histograms

- Purpose: Comparing categories or distributions.
- Interpretive focus: Length and height as quantitative cues.
- Considerations: Beware of misleading axes, scale distortions.

Scatter Plots

- Purpose: Exploring relationships between two variables.
- Interpretive focus: Point position; correlation patterns.
- Considerations: Overplotting, outliers, and scale choices.

Maps and Geospatial Visualizations

- Purpose: Spatial patterns and distributions.
- Interpretive focus: Color gradients, spatial clusters.
- Considerations: Map projections, color schemes for accessibility.

Line Graphs and Time Series

- Purpose: Trends over time.
- Interpretive focus: Slope, peaks, troughs.
- Considerations: Overplotting, scaling issues.

Pie Charts and Circular Visuals

- Purpose: Part-to-whole relationships.
- Interpretive focus: Angles and areas.
- Considerations: Difficult to compare slices; prefer bar charts for accuracy.

Challenges and Pitfalls in Interpreting Graphics

Despite the structured taxonomy, several common challenges hinder accurate interpretation:

- Misleading Visuals: Manipulation of axes, truncation, or disproportionate elements.
- Cognitive Biases: Anchoring, confirmation bias, or overconfidence.
- Color Misuse: Inappropriate color schemes affecting perception or accessibility.
- Complexity and Clutter: Overly dense visuals overwhelming viewers.
- Lack of Context: Missing labels, legends, or annotations impair understanding.

Recognizing these pitfalls is essential for both creators and consumers of graphics.

Implications for Design and Education

Understanding the taxonomy of graphics has direct implications:

- For Designers: Guides the selection of appropriate visual forms aligned with data and purpose.
- For Educators: Provides a curriculum structure to teach visual literacy systematically.
- For Analysts: Aids in selecting analytical tools and interpretive strategies.
- For Consumers: Enhances critical thinking and reduces susceptibility to misinterpretation.

Promoting awareness of the taxonomy fosters a culture of responsible and effective visual communication.

Conclusion: Towards a Systematic Approach to Visual Literacy

The taxonomy of graphics serves as a foundational scaffold for navigating the complex terrain of data visualization. By categorizing graphics based on type, purpose, data mode, and interaction level, viewers and creators can foster more effective communication, critical evaluation, and interpretive accuracy. As data continues to grow in volume and complexity, cultivating a deep understanding of visual taxonomy will be instrumental in building a visually literate society capable of making informed decisions based on graphical information.

In sum, mastering the taxonomy of graphics is not merely an academic exercise but a practical necessity in today's data-driven world. It empowers us to decode, critique, and craft visuals that illuminate rather than obscure, ensuring that the power of graphics is harnessed responsibly and effectively.

interpreting graphics taxonomy: *Visual Representations and Interpretations* Ray Paton, Irene Neilsen, 2012-12-06 The value of multi-disciplinary research and the exchange of ideas and methods across traditional discipline boundaries are well recognised. Indeed, it could be justifiably argued that many of the advances in science and engineering take place because the ideas, methods and the tools of thought from one discipline become re applied in others. Sadly, it is also the case that many subject areas develop specialised vocabularies and concepts and can consequently approach more general problems in fairly narrow, subject-specific ways. Consequently barriers develop between disciplines that prevent the free flow of ideas and the collaborations that on Visual Representations could often bring success. VRI'98, a workshop focused & Interpretations, was intended to break down such barriers. The workshop was held in the Foresight Conference Centre, which occupies part of the former Liverpool Royal Infirmary, a Grade 2 listed building, which has been recently restored. The building combines a majestic architecture with the latest in new conference facilities and technologies and thus provided a very suitable setting for a workshop aimed at bringing the Arts and the Sciences together. of the workshop was to promote inter-disciplinary awareness across The main aim a range of disciplines where visual representations and interpretations are exploited. Contributions to the workshop were therefore invited from researchers who are actively

investigating visual representations and interpretations: - artists, architects, biologists, chemists, clinicians, cognitive scientists, computer scientists, educationalists, engineers, graphic designers, linguists, mathematicians, philosophers, physicists, psychologists and social scientists.

interpreting graphics taxonomy: Visual Data and Their Use in Science Education Jon Pedersen, Kevin D. Finson, 2013-04-01 Visual Data in Science Education builds upon previous work done by the editors to bring some definition to the meaning of visual data as it relates to education, and highlighted the breadth of types and uses of visual data across the major academic disciplines. In this book, the editors have brought this focus specifically to science education through the contributions of colleagues in the field who actively research about and engage in teaching with visual data. The book begins by examining how the brain functions with respect to processing visual data, then explores models of conceptual frameworks, which then leads into how related ideas are actuated in education settings ranging from elementary science classrooms to college environments. As a whole, this book fosters a more coherent image of the multifaceted process of science teaching and learning that is informed by current understandings of science knowledge construction, the scientific enterprise, and the millennium student as they relate to visual data.

interpreting graphics taxonomy: Computer Vision, Imaging and Computer Graphics Theory and Applications A. Augusto de Sousa, Vlastimil Havran, Alexis Paljic, Tabitha Peck, Christophe Hurter, Helen Purchase, Giovanni Maria Farinella, Petia Radeva, Kadi Bouatouch, 2023-02-01 This book constitutes the refereed proceedings of the 16th International Joint Conference on Computer Vision, Imaging and Computer Graphics Theory and Applications, VISIGRAPP 2021, held as a virtual event, February 8-10, 2021. The 16 full papers presented in this volume were carefully reviewed and selected from 371 submissions. The purpose of VISIGRAPP is to bring together researchers and practitioners interested in both theoretical advances and applications of computer vision, computer graphics and information visualization. VISIGRAPP is composed of four co-located conferences, each specialized in at least one of the aforementioned main knowledge areas, namely GRAPP, IVAPP, HUCAPP and VISAPP. The contributions were organized in topical sections as follows: Computer Graphics Theory and Applications; Human Computer Interaction Theory and Applications; Information Visualization Theory and Applications; Computer Vision Theory and Applications.

interpreting graphics taxonomy: Graphic Inquiry Daniel Callison, Annette Lamb, 2012-05-03 This full-color book provides a practical approach to incorporating graphic inquiry across the curriculum for school library media specialists, technology coordinators, and classroom teachers. It's new. It's graphic. And it is the first of its kind. Designed to bridge theory and actual practice, Graphic Inquiry contains applications for new and practicing educators and librarians that can truly bring classroom learning into the 21st century. This visually rich book provides numerous, standards-based inquiry activities and projects that incorporate traditional materials as well as emerging social and collaborative technologies. This full-color book provides real-world strategies for integrating graphic inquiry across the curriculum and is specifically designed to help today's educators identify tools and techniques for using graphic inquiry with their students. Although research is cited and references are provided, lengthy text passages are avoided in favor of practical, visual examples rooted in best practice and presented in graphic format. Readers will view this book as a quick reference to timely, realistic activities and approaches as compared to a traditional textbook.

interpreting graphics taxonomy: Advances in Design and Digital Communication III Nuno Martins, Daniel Brandão, 2022-10-26 This book reports on research findings and practical lessons featuring advances in the areas of digital and interaction design, graphic design and branding, design education, society and communication in design practice, and related ones. Gathering the proceedings of the 6th International Conference on Digital Design and Communication, Digicom 2022, held on November 3-5, 2022, as an hybrid event, from Barcelos, Portugal, and continuing the tradition of the previous book, it describes new design strategies and solutions to foster digital communication within and between the society, institutions and brands. By

highlighting innovative ideas and reporting on multidisciplinary projects, it offers a source of inspiration for designers of all kinds, including graphic and web designers, UI, UX and social media designers, and to researchers, advertisers, artists, and brand and corporate communication managers alike.

Ródenas-López, José Calvo-López, Macarena Salcedo-Galera, 2022-04-27 This book reports on several advances in architectural graphics, with a special emphasis on education, training and research. It gathers a selection of contributions to the 19th International Conference on Graphic Design in Architecture, EGA 2022, held on June 2-4, 2022, in Cartagena, Spain, with the motto: Beyond drawings. The use of architectural graphics.

interpreting graphics taxonomy: *Computer Vision and Graphics* Leonard Bolc, Ryszard Tadeusiewicz, Leszek J. Chmielewski, Konrad Wojciechowski, 2010-09-14 Annotation This book is part I of a two-volume work that contains the refereed proceedings of the International Conference on Computer Vision and Graphics, ICCVG 2010, held in Warsaw, Poland, in September 2010. The 95 revised full papers presented were carefully reviewed and selected from numerous submissions. The papers are organized in three topical sections: advances in pattern recognition, machine vision and image understanding; human motion analysis and synthesis; and computer vision and graphics.

interpreting graphics taxonomy: *Advances in Computer Graphics V* Werner Purgathofer, Jürgen Schönhut, 2012-12-06 This book collects together several of the tutorials held at EUROGRAPHICS'89 in Hamburg. The conference was held under the motto Integration, Visualisation, Interaction and the tutorials reflect the conference theme. The Springer series EurographicSeminars with the volumes *Advances in Computer Graphics* regularly provides a professional update on current mainstream topics in the field. These publications give readers the opportunity to inform themselves thoroughly on the topics covered. The success of the series is mainly based on the expertise of the contributing authors, who are recognized professionals in their field. Starting out with one of the conference's main topics, the chapter Visualization of Scientific Data gives an overview of methods for displaying scientific results in an easily surveyable and comprehensible form. It presents algorithms and methods utilized to achieve visualization results in a form adequate for humans. User interfaces for such systems are also explored, and practical conclusions are drawn. The chapter Color in Computer Graphics describes the problems of manipulating and matching color in the real world. After some fundamental statements about color models and their relationships, the main emphasis is placed on the problem of objective color specification for computer graphics systems. It is very hard to match colors between devices such as scanners, printers and displays. Some suggestions on the effective use of color for graphics are also made.

VISIGRAPP comprises GRAPP, International Conference on Computer Graphics Theory and Applications; IVAPP, International Conference on Information Visualization Theory and Applications; and VISAPP, International Conference on Computer Vision Theory and Applications. The 23 thoroughly revised and extended papers presented in this volume were carefully reviewed and selected from 529 submissions. The book also contains one invited talk in full-paper length. The regular papers were organized in topical sections named: computer graphics theory and applications; information visualization theory and applications; and computer vision theory and applications.

interpreting graphics taxonomy: *Computer Vision, Imaging and Computer Graphics - Theory and Applications* Sebastiano Battiato, Sabine Coquillart, Julien Pettré, Robert S. Laramée, Andreas Kerren, José Braz, 2016-01-06 This book constitutes the refereed proceedings of the International Conference, VISIGRAPP 2014, consisting of the Joint Conferences on Computer Vision

(VISAPP), the International Conference on Computer Graphics, GRAPP 2014 and the International Conference on Information Visualization, IVAPP 2014, held in Lisbon, Portugal, in January 2014. The 22 revised full papers presented were carefully reviewed and selected from 543 submissions. The papers are organized in topical sections on computer graphics theory and applications; information visualization – theory and applications; computer vision theory and applications.

interpreting graphics taxonomy: Graphics Recognition. Recent Advances Atul K. Chhabra, Dov Dori, 2003-06-29 This edited volume contains refereed and improved versions of select papers 1 that were presented at the third IAPR Workshop on Graphics Recognition (GREC'99), held at Rambagh Palace in Jaipur, India, 26-27, September 1999. The workshop was organized by the TC10 (Technical Committee on Graphics Recognition) of the IAPR. Edited volumes from the previous two workshops in this series are also available as Lecture Notes in Computer Science (volumes 1072 and 1389). Graphics recognition is the study of techniques for computer interpretation of images of line drawings and symbols. This includes methods such as vectorization, symbol recognition, and table and chart recognition for applications such as engineering drawings, schematics, logic drawings, maps, diagrams, and musical scores. Some recently developed techniques include graphics-based information or drawing retrieval and recognition of online graphical strokes. With the recent advances in the field, there is now a need to develop benchmarks for evaluating and comparing algorithms and systems. Graphics recognition is a growing field of interest in the broader document image recognition community. The GREC'99 workshop was attended by fifty-five people from fifteen countries. The workshop program consisted of six technical sessions. Each session began with a half-hour invited talk which was followed by several short talks. Each session closed with a half-hour panel discussion where the authors fielded questions from the other participants. Several interesting new research directions were discussed at the workshop.

interpreting graphics taxonomy: *How Maps Work* Alan M. MacEachren, 2004-06-21 Now available in paperback for the first time, this classic work presents a cognitive-semiotic framework for understanding how maps work as powerful, abstract, and synthetic spatial representations. Explored are the ways in which the many representational choices inherent in mapping interact with information processing and knowledge construction, and how the resulting insights can be used to make informed symbolization and design decisions. A new preface to the paperback edition situates the book within the context of contemporary technologies. As the nature of maps continues to evolve, Alan MacEachren emphasizes the ongoing need to think systematically about the ways people interact with and use spatial information.
