Sample Questions and Answer Explanations

Below are illustrative examples of typical workbook exercises and their

solutions to demonstrate the depth of content covered.

Question 1: Describe the process of photosynthesis.

Answer:

Photosynthesis is the process by which green plants, algae, and some bacteria convert light energy into chemical energy stored in glucose molecules. It occurs primarily in the chloroplasts of plant cells, utilizing chlorophyll.

The general equation is:

$$6\text{CO}_2 + 6\text{H}_2\text{O} + \text{light energy} \rightarrow \text{C}_6\text{H}_{12}\text{O}_6 + 6\text{O}_2$$

This process involves two main stages: the light-dependent reactions and the light-independent reactions (Calvin cycle). During these, light energy splits water molecules (photolysis), releasing oxygen, and synthesizes glucose from carbon dioxide.

Question 2: Explain the role of DNA in heredity.

Answer:

DNA (deoxyribonucleic acid) carries genetic information essential for inheritance. It is composed of nucleotide sequences that encode instructions for building and maintaining an organism. During reproduction, DNA is replicated, passing genetic traits from parents to offspring. Genes, segments of DNA, determine specific characteristics. Mutations in DNA can lead to variations within a species, contributing to evolution.
