Understanding Cannabis Oil Extraction

Cannabis oil extraction involves isolating the active compounds—primarily cannabinoids like THC and CBD—from the cannabis plant material. The process aims to produce a concentrated oil that retains the plant's therapeutic properties while removing undesirable elements such as plant matter, chlorophyll, and residual solvents.

The choice of extraction method significantly influences the quality, safety, and efficiency of the final product. Factors to consider include:

- Desired potency
- Purity and purity level
- Safety and environmental considerations
- Equipment availability and cost
- Scale of production

Popular Cannabis Oil Extraction Methods

Various extraction techniques are employed in the industry, each with unique mechanisms and outcomes. Below, we detail the most common methods, their processes, and their pros and cons.

1. Solvent-Based Extraction Methods

Solvent extraction involves using a liquid solvent to dissolve cannabinoids and other plant constituents. Once the cannabinoids are dissolved, the solvent is evaporated, leaving behind the concentrated oil.

a. Ethanol Extraction

Ethanol extraction is one of the safest and most accessible solvent methods.

Process:

- The plant material is soaked in food-grade ethanol.
- The mixture is agitated to allow cannabinoids and terpenes to dissolve.
- The liquid is filtered to remove plant solids.

- The ethanol is evaporated under controlled conditions, leaving behind the concentrated oil.

Advantages:

- Safe and environmentally friendly
- Effective at extracting cannabinoids and terpenes
- Suitable for large-scale production

Disadvantages:

- May extract chlorophyll, resulting in a darker, more bitter extract
- Requires proper evaporation equipment to remove residual ethanol

b. Butane and Propane Extraction (BHO/PHO)

Butane Hash Oil (BHO) and Propane Hash Oil (PHO) are popular solvent methods used mainly in concentrates.

Process:

- Cannabis plant material is packed into a closed-loop extraction system.
- Butane or propane is passed through the material to dissolve cannabinoids.
- The solvent-cannabinoid mixture is collected.
- The solvent is evaporated using vacuum purging to remove residual hydrocarbons.

Advantages:

- Produces high-potency concentrates
- Efficient extraction of cannabinoids and terpenes
- Fast process

Disadvantages:

- Flammable and potentially dangerous if not handled properly
- Risk of residual solvent contamination
- Requires specialized equipment and safety protocols

2. Non-Solvent Extraction Methods

Non-solvent methods avoid the use of potentially hazardous chemicals, relying instead on physical processes.

a. CO₂ (Carbon Dioxide) Extraction

Supercritical CO₂ extraction is considered the gold standard for clean, high-quality cannabis oil.

Process:

- CO₂ is pressurized beyond its critical point to become supercritical, acting as both a gas and a

liquid.

- Supercritical CO₂ passes through the plant material, dissolving cannabinoids and terpenes.
- The mixture is depressurized, causing CO₂ to revert to gas and leaving behind the extract.

Advantages:

- Produces pure, solvent-free extracts
- Adjustable parameters for selective extraction
- Safe and environmentally friendly

Disadvantages:

- Expensive equipment and maintenance
- Requires technical expertise
- Slower process compared to solvent methods

b. Mechanical and Physical Methods (Ice Water Hash, Dry Sifting)

These methods focus on physically separating trichomes—the resin glands containing cannabinoids.

Ice Water Hash:

- Cannabis is agitated in ice-cold water, causing trichomes to break off.
- The mixture is filtered through screens of varying sizes.
- Trichomes are dried to produce hash.

Dry Sifting:

- Dried cannabis is rubbed over fine screens.
- Trichomes fall through the screens and are collected.

Advantages:

- No chemicals involved
- Produces high-quality, solventless concentrates
- Safe and simple

Disadvantages:

- Lower yields compared to solvent methods
- Labor-intensive
- Quality depends on technique and equipment

3. Other Extraction Techniques

While less common, some innovative methods are gaining popularity.

a. Olive Oil Extraction

A traditional, safe method suitable for home use.

Process:

- Decarboxylate cannabis in an oven.
- Simmer plant material in olive oil for several hours.
- Strain out plant matter.

Advantages:

- Safe and simple
- Edible and versatile

Disadvantages:

- Low potency
- Short shelf life
- Not suitable for commercial scale

b. Rosin Extraction

A solventless heat and pressure technique.

Process:

- Apply heat and pressure to cannabis flower or hash.
- Resin is pressed out and collected.

Advantages:

- No solvents involved
- Produces high-quality concentrates

Disadvantages:

- Equipment cost
- Requires skill for optimal results

Choosing the Right Extraction Method

Selecting the best extraction method depends on several factors:

- Purpose (medical, recreational, industrial)
- Scale of operation
- Budget and equipment availability
- Safety considerations
- Desired product characteristics (potency, purity, flavor)

Safety and Legal Considerations

Always prioritize safety when handling solvents like butane or propane. Proper ventilation, protective gear, and adherence to local laws and regulations are essential. Many home extraction methods involving volatile solvents pose risks and may be illegal in certain jurisdictions.

cannabis oil extraction methods pdf: Medicinal Cannabis: Evolution of Therapeutic Use, Future Approaches and Other Implications, Volume II Paola Brusa, Francesca Baratta, Shimon Ben-Shabat, Massimo Collino, 2023-12-04 This Research Topic is the second volume of its kind.

Please see the publications of the first collection here. Cannabis has been used in even the oldest traditional medicines available. In the last century, somewhat negative attention has prevailed when it comes to the psychotropic and addictive effects and abuse potential; for this reason Cannabis has been banned and is illegal in many countries. In recent years, however, there has been a more in-depth evaluation of the legalization of cannabinoids for medical use in several countries following heightened media attention and reports of effectiveness, although not always thoroughly backed up by scientific evidence. In fact, up to now the results from studies discussing the efficacy of the medical use of Cannabis are sometimes contradictory and not always conclusive. Some factors fueling this inconclusiveness include the heterogeneous nature of the studied populations, different Cannabis preparations and dosages, studies with uncontrolled settings and different routes of administration. Moreover, these uncertainties are partly derived from legislative restrictions which, over time, have severely limited the conduction of rigorous, controlled, and comparable studies. The official introduction of pharmaceutical grade Cannabis inflorescences for medicinal purposes has allowed physicians and pharmacists respectively to legally prescribe and prepare several Cannabis preparations. Such products are currently being administered to patients without their efficacy being evaluated in controlled studies: for each patient the composition and route of administration may be different. In addition, many advanced administration systems have been developed or are still under development, but few clinical trials have been completed. This second volume welcomes submissions of Original Research and Review articles building on and focusing on the in-depth analysis of the legal, technological and pharmacological aspects related to the medical use of chemically characterized Cannabis-based formulations. Studies carried out in the past or still in progress will also be considered to assess what evolution there has been in using Cannabis to treat diseases or conditions. We invite submissions dealing with the following themes, including but not limited to: • Cannabis-based formulations: current and future applications in therapy. • Legal, technological, and pharmacological aspects related to the medical use of Cannabis. • Non-clinical evidence supporting therapeutic applications of Cannabis (including in vivo, in vitro and in silico studies) Important note for Authors : Only studies dealing with highly purified, chemically characterized Cannabis containing formulations, where the chemical structure and purity must be precisely described by appropriate analytical methods will be considered for review in Experimental Pharmacology and Drug Discovery. The following studies can be accepted for review in Ethnopharmacology if the extract is characterised in sufficient detail as is needed for a licensed medicine (see here.) (I) Clinical Trial articles will be accepted for review only in the case that they are randomized, double-blinded, and placebo controlled. (II) Any studies relating to advanced formulations or galenic preparations to better evaluate the potential effects of their application in future therapies.

Spices lend color, taste, and flavor, and oleoresins are good source of antioxidants and have preservative as well as therapeutic power. Therefore it is important to understand and document the chemistry, characterization, properties and applications of oleoresins, as found in this handbook.

cannabis oil extraction methods pdf: Environmental Humanities of Extraction in Africa

James Ogude, Tafadzwa Mushonga, 2022-08-17 This book brings together perspectives on resource exploitation to expose the continued environmental and socio-political concerns in post-colonial Africa. The continent is host to a myriad of environmental issues, largely resulting from its rich diversity of natural resources that have been historically subjected to exploitation. Colonial patterns of resource use and capital accumulation continue unabated, making environmental and related socio-political problems a dominant feature of African economies. The book pursues the manifestation of these problems through four themes: environmental justice, violent capitalocenes, indigenous knowledge, and climate change. The editors locate the book within the broad fields of political ecology and environmental geopolitics to highlight the intricate geographies of resource exploitation across Africa. It uniquely focuses on the socio-political and geopolitical dynamics associated with the exploitation of Africa's natural resources and its people. The case studies from different parts of Africa tell a compelling story of resource exploitation, related issues of environmental degradation in a continent particularly vulnerable to climate change, and the continued plundering of its natural resources. The book will be of great interest to scholars and students from the interdisciplinary fields of the environmental humanities and environmental studies more broadly, as well as those studying political ecology, environmental policy, and natural resources with a specific focus on Africa.

cannabis oil extraction methods pdf: Modern Supercritical Fluid Chromatography Larry M.

Miller, J. David Pinkston, Larry T. Taylor, 2019-11-06 Explains why modern supercritical fluid chromatography (SFC) is the leading green analytical and purification separations technology. Modern supercritical fluid chromatography (SFC) is the leading method used to analyze and purify chiral and achiral chemical compounds, many of which are pharmaceuticals, pharmaceutical candidates, and natural products including cannabis-related compounds. This book covers current SFC instrumentation as it relates to greater robustness, better reproducibility, and increased analytical sensitivity. Modern Supercritical Fluid Chromatography: Carbon Dioxide Containing Mobile Phases covers the history, instrumentation, method development and applications of SFC. The authors provided readers with an overview of analytical and preparative SFC equipment, stationary phases, and mobile phase choices. Topics covered include: Milestones of Supercritical Fluid Chromatography; Physical Properties of Supercritical Fluids; Instrumentation for SFC; Detection in SFC; Achiral SFC Method Development; Chiral SFC Method Development; and Preparative Scale SFC. The book also includes highlights of modern applications of SFC in the final chapters—namely pharmaceuticals, consumer products, foods, polymers, petroleum-related mixtures, and cannabis—and discusses the future of SFC. Provides a clear explanation of the physical and chemical properties of supercritical fluids, which gives the reader a better understanding of the basis for improved performance in SFC compared to HPLC and GC Describes the advantages of SFC as a green alternative to HPLC and GC for the analysis of both polar, water-soluble, and non-polar analytes Details both achiral and chiral SFC method development, including modifiers, additives, the impact of temperature and pressure, and stationary phase choices

Details why SFC is the premier modern preparative chromatographic technique used to purify components of mixtures for subsequent uses, both from performance and economic perspectives Covers numerous detectors, with an emphasis on SFC-MS, SFC-UV, and SFC-ELSD (evaporative light scattering detection) Describes the application of SFC to numerous high-value application areas Modern Supercritical Fluid Chromatography: Carbon Dioxide Containing Mobile Phases will be of great interest to professionals, students, and professors involved in analytical, bioanalytical, separations science, medicinal, petroleum, and environmental chemistries. It will also appeal to pharmaceutical scientists, natural-product scientists, food and consumer-products scientists, chemical engineers, and managers in these areas.
