Understanding Linear Programming

What Is Linear Programming?

Linear programming (LP) is a mathematical method used for optimizing a linear objective function, subject to a set of linear constraints. It is widely applied in areas such as operations research, economics, logistics, manufacturing, and finance to maximize profits or minimize costs.

Core Components of Linear Programming

A typical LP problem consists of:

- **Objective Function:** The function to be maximized or minimized (e.g., profit, cost).
- **Decision Variables:** Variables that influence the objective function.
- **Constraints:** Linear inequalities or equations that restrict the decision variables.
- **Non-negativity Restrictions:** Often, decision variables are constrained to be non-negative.

Sample Problem and Solution from a Typical PDF

Problem Statement

A factory produces two products, A and B. Each unit of Product A requires 3 hours of labor and 2

units of raw material. Each unit of Product B requires 2 hours of labor and 4 units of raw material. The factory has a maximum of 18 hours of labor and 16 units of raw material available per day. The profit per unit for Product A is \$30, and for Product B is \$40. Determine the optimal production mix to maximize profit.

Formulating the LP

Let:

- x_A = number of units of Product A
- x_B = number of units of Product B

Objective Function:

$$\text{Maximize } Z = 30x_A + 40x_B$$

Constraints:

$$3x_A + 2x_B \leq 18 \text{ (Labor constraint)}$$

$$2x_A + 4x_B \leq 16 \text{ (Raw material constraint)}$$

$$x_A \geq 0, x_B \geq 0$$

Solution Approach

Using graphical methods or simplex algorithm, the feasible region is identified, and the optimal point is found at the intersection of constraints where profit is maximized.

Solution Summary

By solving the LP, the optimal solution might be:

$$x_A = 4, \quad x_B = 4$$

Maximum profit:

$$Z = 30(4) + 40(4) = 120 + 160 = \$280$$
