Understanding the Perceived Devaluation-Discrimination Scale

What Is the Perceived Devaluation-Discrimination Scale?

The perceived devaluation-discrimination scale is a self-report questionnaire designed to assess an individual's beliefs about societal attitudes. It captures perceptions of how likely others are to devalue or discriminate against them if their social identity becomes known or is assumed.

Key features include:

- Focus on perceived societal attitudes rather than personal beliefs.
- Measures anticipated discrimination and devaluation.
- Useful across various populations, including individuals with mental health issues, racial minorities, and other marginalized groups.

Theoretical Background

The scale is grounded in social psychology theories related to stigma and stereotype threat. It operates on the premise that perceptions of societal devaluation can lead to internalized stigma, affecting individuals' mental health and social functioning.

Studies have demonstrated that higher perceived discrimination correlates with:

- Increased psychological distress.
- Lower self-esteem.
- Reduced social engagement.

Understanding these perceptions allows for targeted interventions to mitigate negative outcomes associated with stigma.

Structure and Components of the Scale

Format and Items

The perceived devaluation-discrimination scale typically consists of statements rated on a Likert scale (e.g., from "Strongly Disagree" to "Strongly Agree"). Common items include:

- "Most people believe that someone with my condition is unreliable."
- "Most people would discriminate against me if they knew about my mental health status."
- "People generally see me as less capable because of my condition."

Participants indicate their agreement with these statements based on their perceptions of societal attitudes.

Scoring and Interpretation

Scores are aggregated to produce an overall perceived discrimination score. Higher scores indicate greater perceptions of societal devaluation and discrimination. These scores can be used:

- To assess individual experiences.
- To compare across different groups.
- To evaluate the effectiveness of anti-stigma interventions.

perceived devaluation discrimination scale pdf: Examining the Relationship Between Experiences of Discrimination and Psychological Reactance Nathaniel S. Wareham, 2011 Psychological reactance is a motivational state caused by a perceived threat to an individual's freedom to behave as he or she chooses. In this state individuals are motivated to restore the perception of freedom. Past research on reactance has suggested that it is possible that repeatedly experiencing a reactive state may contribute to increasing trait reactance, which is the individual's general tendency to experience reactance in a given situation. Research on discrimination has suggested that experiencing discrimination may induce a reactive state, but has not empirically tested that idea. Study 1 hypothesized that there would be a positive correlation between the amount of discrimination perceived by an individual and the individual's level of trait reactance. Study 2 hypothesized that participants asked to recall a discriminatory event would experience more state reactance than those in the control condition. Study 1's hypothesis was supported by correlations between the Perceived Discrimination Scale (Dowd, Milne, & Wise, 1991), the Therapeutic Reactance Scale, the Hong Psychological Reactance Scale (Hong, 1992) and the majority of the Hong subscales. A subjective measure of discrimination experienced due to group membership was also correlated with the same reactance scales. Study 2's hypothesis was also supported when participants asked to recall a discriminatory incident scored significantly higher on cognitive and emotional measures designed to assess state reactance. Together the findings of both studies suggest that experiencing state reactance repeatedly throughout an individual's life leads to an increase in that individual's level of trait reactance. If trait reactance is a result of discriminatory experiences then, such information could help inform the therapeutic treatment of clients likely to have experienced discrimination--Document.
