Key Components of Infusion Therapy Standards of Practice PDF

Patient Assessment and Planning

Proper assessment is foundational to safe infusion therapy. Standards emphasize:

1. Comprehensive patient assessment, including medical history, vascular access needs, and potential risks.
2. Evaluation of the patient's understanding and preferences regarding infusion therapy.
3. Development of an individualized infusion plan considering clinical indications, patient condition, and site selection.

Vascular Access Device Selection

Choosing the appropriate device is critical to minimizing complications.

- Types of devices include peripheral IVs, midline catheters, peripherally inserted central catheters (PICCs), and tunneled central lines.
- Selection depends on duration of therapy, type of infusion, patient anatomy, and risk factors.
- Standards provide guidance on device insertion, maintenance, and removal.

Insertion and Maintenance Procedures

The PDF outlines best practices for insertion and ongoing care:

- Use of aseptic technique during insertion to prevent infection.
- Verification of proper placement through appropriate methods (e.g., X-ray for central lines).
- Regular assessment of catheter site for signs of infection, infiltration, or thrombosis.
- Securement devices and dressings to prevent dislodgement and contamination.

Infusion Administration Guidelines

Effective and safe administration practices include:

1. Verification of medication orders and compatibility.
2. Use of appropriate infusion pumps and controllers.
3. Monitoring flow rates and infusion site regularly.

4. Adjusting or stopping infusions based on patient response or adverse reactions.

Infection Control and Prevention

infusion therapy standards of practice pdf: Vessel Health and Preservation: The Right Approach for Vascular Access Nancy L. Moureau, 2019-06-10 This Open access book offers updated and revised information on vessel health and preservation (VHP), a model concept first published in poster form in 2008 and in JVA in 2012, which has received a great deal of attention, especially in the US, UK and Australia. The book presents a model and a new way of thinking applied to vascular access and administration of intravenous treatment, and shows how establishing and maintaining a route of access to the bloodstream is essential for patients in acute care today. Until now, little thought has been given to an intentional process to guide selection, insertion and management of vascular access devices (VADs) and by default actions are based on crisis management when a quickly selected VAD fails. The book details how VHP establishes a framework or pathway model for each step of the patient experience, intentionally guiding, improving and eliminating risk when possible. The evidence points to the fact that reducing fragmentation, establishing a pathway, and teaching the process to all stakeholders reduces complications with intravenous therapy, improves efficiency and diminishes cost. As such this book appeals to bedside nurses, physicians and other health professionals.
