Understanding Runners' Knee (Patellofemoral Pain Syndrome)

What Is Runners' Knee?

Runners' knee, medically known as Patellofemoral Pain Syndrome (PFPS), is a common overuse injury characterized by pain around or behind the kneecap (patella). It often affects runners, athletes, and individuals engaged in repetitive knee-flexion activities. The pain may worsen during activities such as running, jumping, climbing stairs, or prolonged sitting.

Causes and Risk Factors

Several factors can contribute to the development of runners' knee, including:

- Overtraining or sudden increase in activity intensity
- Improper running techniques or gait abnormalities
- Weak or imbalanced thigh and hip muscles
- Flat feet or overpronation
- Inadequate footwear
- Previous knee injuries
- Poor biomechanics or alignment issues

Symptoms of Runners' Knee

Common symptoms include:

- Pain around or behind the kneecap
- Increased pain during activity, especially running or jumping
- Discomfort when sitting for long periods
- Grinding or clicking sensations in the knee
- Swelling or tenderness around the kneecap

How KT Tape Helps with Runners' Knee

What Is Kinesiology Tape?

Kinesiology tape, such as KT Tape, is an elastic therapeutic tape designed to support muscles and joints without restricting movement. It is used to reduce pain, improve circulation, and enhance proprioception—an awareness of joint position.

Mechanisms of Action

Applying KT Tape to the knee can provide several benefits:

- Alleviating pressure on the patellofemoral joint
- Supporting the muscles around the knee to stabilize the joint
- Reducing inflammation and swelling
- Enhancing blood and lymph flow to promote healing
- Improving proprioception and movement mechanics

Why Use a Runners' Knee PDF Guide?

A PDF guide on KT Tape application offers:

- Step-by-step instructions tailored for runners' knee

- Visual diagrams and illustrations for accurate application
- Tips to maximize tape effectiveness
- Prevention strategies to avoid recurrence

How to Use the Runners' Knee PDF for KT Tape Application

Preparing for Application

Before applying KT Tape:

- Clean and dry the skin to ensure good adhesion
- Shave excess hair around the knee area if necessary
- Gather necessary supplies: KT Tape, scissors, alcohol wipes (optional)

Step-by-Step Application Guide

While specific application techniques may vary, a typical runners' knee taping method involves the following steps:

1. **Measure and Cut the Tape:** Cut strips of KT Tape according to the length needed, typically around 10-12 inches for knee applications.
2. **Prepare the Skin:** Clean the skin and remove any oils or lotions.
3. **Anchor the Tape:** Apply the first anchor (without stretch) just below the kneecap on the thigh or calf, depending on the technique.
4. **Apply the Support Strips:** Stretch the tape slightly (about 25-50%) and lay it over the area, crossing over the kneecap or supporting the sides, depending on the method.
5. **Secure the Ends:** Rub the ends of the tape to activate the adhesive.
6. **Check for Comfort:** Ensure the tape is snug but not constricting, and that movement is comfortable.

Popular Taping Techniques for Runners' Knee

Some effective taping strategies include:

- **V-shaped Pattern:** Applying strips in a V-shape around the kneecap to lift it slightly and reduce pressure.
- **Lateral Support:** Applying tape along the outer side of the knee to stabilize the patella.
- **Medial Support:** Supporting the inner side of the knee if alignment issues are present.

kt tape runners knee pdf: The Effects of Kinesiology Tape on Active Knee Flexion Alexis Montgomery, 2018 INTRODUCTION: Kinesiology tape (KT) is used in therapeutic clinics, chiropractic clinics, and sports settings as a tool to prevent or treat injuries. Some of the reported benefits of KT include decreasing pain, decreasing edema, increasing muscle strength, and improving circulation throughout the body. The current study evaluated the effects of KT on active knee ROM. METHOD: Forty students (29 females, 11 males) between the ages of 19-26 participated in the study. Two strips of KT were applied to the medial and lateral side of the patella on the right knee under these conditions; no tape, 0% elongation, 25% elongation, and 50% elongation. ROM was measured using the Microfet-3. RESULTS: A one-way analysis of variance (ANOVA) with repeated measures found no significant differences in the effects of KT on active knee flexion. (Greenhouse-Geisser $F(2.38, 92.8) = 2.673, p = 0.065$). CONCLUSION: KT applied at 0%, 25%, and 50% elongation showed to have no significant effect on active knee ROM. These results suggest that KT does not restrict ROM when applied with tension over a joint. Future research needs to be done to determine the possible benefits of KT over longer periods of time.

kt tape runners knee pdf: Effects of Kinesio Tape on Proprioception When Applied to the Post-Surgical Knee Among Collegiate Athletes Heather C. Patterson, 2014 The purpose of this study was to examine if the application of Kinesio tape on the post-surgical knee would have an effect on proprioception in collegiate athletes. Participants in this study were 8 post-surgical athletes and 10 healthy athletes who participate in Division I varsity athletics at Central Connecticut State University (N=18). The hypothesis states there will be no significant difference between the Kinesio tape condition and no tape condition, and Kinesio tape will have no effect on proprioception at the knee after surgery. Proprioception was measured using the Biodex Balance System, single leg stability test. In the healthy participants the knee tested was randomly selected and the surgical participants were between 8 weeks and 1 year post-surgical. Biodex Balance system measured proprioception in three directions: anterior/posterior, medial/lateral, and overall stability. Proprioception was measured in two conditions, a Kinesio tape condition and no tape condition in both the post-surgical knee athletes and the healthy athletes. The study found no significant difference between the Kinesio tape and no tape conditions in both the post-surgical and healthy groups. Future research should focus on the injured population, specifically EMG activity with the application of Kinesio tape during the first couple weeks after ACLR surgery. In conclusion there is no data to support that Kinesio tape has an effect on proprioception when applied to the knee in the healthy athlete and in the post-surgical athlete. It is recommended the current protocol for ACLR rehabilitation is the standard of care.
