clsi guidelines 2023 pdf: Conference Research Topic: 9th Symposium on Antimicrobial Resistance in Animals and the Environment (ARAE 2023) Benoit Doublet, Michel Stanislas Zygmunt, Axel Cloeckaert, Sebastien Olivier Leclercq, 2025-02-03 The emergence of antimicrobial resistance is a seminal public health concern. Significant progress has been made in recent years regarding an understanding of the genetic and biochemical basis for antimicrobial resistance, the emergence of resistance genes, and factors promoting their widespread dissemination including the role of lateral gene transfer. Nevertheless, there is a dearth of information regarding the key 'hotspots' and genetic mechanisms responsible for resistance development, and the exposure routes leading to the failure of antimicrobial agents important in human and animal medicine. There is thus an urgent need for research to provide governments, public health stakeholders, and the agricultural sector the knowledge required to develop policies and practices that effectively mitigate resistance development. This, within a growing recognition that humans, animals and the environment must be considered as intimately linked together if any resistance management strategy is to be successful.
