Extraction of Beta-Carotene from Carrot PDF: A Comprehensive Review

Beta-carotene, a vibrant orange pigment belonging to the carotenoid family, is renowned for its potent antioxidant properties and its role as a precursor to vitamin A. Extracting this valuable compound from carrots has garnered significant scientific interest due to its applications in food, pharmaceutical, and cosmetic industries. This detailed review delves into the various aspects of beta-carotene extraction from carrots, emphasizing methods,

optimization strategies, challenges, and recent advancements, with particular reference to PDF-based studies and protocols.

Introduction to Beta-Carotene and Its Significance

Beta-carotene is a naturally occurring carotenoid pigment that imparts the characteristic orange color to carrots. Its antioxidant capacity helps combat oxidative stress, contributing to health benefits like improved vision, immune support, and skin health. The global demand for natural beta-carotene as a food additive and supplement has driven research into efficient extraction techniques from plant sources, especially carrots, which are rich in this compound.

Key Attributes of Beta-Carotene:

- Chemical Structure: Tetraterpene hydrocarbon with 40 carbon atoms.
- Solubility: Lipophilic; soluble in organic solvents like hexane, acetone, ethanol.
- Stability: Sensitive to light, heat, and oxygen, necessitating careful handling during extraction.

Understanding the Carrot Matrix for Extraction

The carrot (*Daucus carota*) root comprises primarily:

- Carotenoid-rich chromoplasts: The primary source of beta-carotene.
- Cell wall components: Pectins, cellulose, hemicellulose—forms barriers to extraction.
- Lipids and proteins: Influence solubility and extraction efficiency.

Effective extraction begins with understanding this matrix, as the localization and binding of beta-carotene in cellular structures influence the choice of extraction method.

Pre-Extraction Processing and Sample Preparation

Before extraction, carrots must undergo thorough preparation:

1. Cleaning: Removal of dirt and impurities.
2. Peeling (optional): Depending on the study, peeling may be performed to reduce contaminants.
3. Chopping or grinding: To increase surface area, carrots are chopped into small pieces or

homogenized.

4. Drying (optional): Freeze-drying or oven-drying can be employed to stabilize samples and prevent degradation.

5. Grinding into powder: Fine powder enhances extraction efficiency by exposing more carotenoid-rich tissues.

In PDF studies, detailed protocols often specify parameters such as drying temperature (e.g., 50°C for oven-drying) and grinding particle size (e.g., passing through a 0.5 mm sieve).

extraction of beta carotene from carrot pdf: Study on Factors Affecting Extraction of Carotene from Carrot by Using Soxhlet Extraction Method Mohamad Zaidi Yahaya, 2013 In this research, carotene in the carrot (*Daucus carota* L.) was extracted by using Soxhlet extraction method. Carotene as a pigment that naturally contained in most vegetables is important source of nutrients. The main constituent of the carotenes which is beta-carotene was investigated. Two variables were varied in order to investigate the effect of drying time and solid-to-solvent ratio on the extraction and beta-carotene yield. Samples with different water content were prepared according to drying time of 3 h, 6 h, 9 h, 12 h, and 24 h at 60°C. The solvent used in the extraction process is 2-propanol with solid-to-solvent ratio of 1:4, 1:6, 1:8, and 1:10. After the extraction process, the mixture of carotene and solvent was separated using rotary evaporator in order to get extracted carotene. Then, the extracted carotene was analyzed using HPLC to determine the beta-carotene yield. From HPLC analysis, it shows the composition of beta-carotene in the extracted carotene increase as increasing drying time and solid-to-solvent ratio. This is due to less presence of water content in the sample and the excess of solvent used enhance the extraction process. The study found that optimal operating condition for this carotene extraction process was obtained at 12 h of drying time and 1:10 of solid-to-solvent ratio.

extraction of beta carotene from carrot pdf: Development of an Expeller Extraction for Beta-carotene from Carrot Pomace Via Lecithin-Linkers Microemulsions Shuting Lin, 2018 This work introduces a new green extraction solvent, based on fully dilutable lecithin-linkers microemulsions (LLMs), that is used in a continuous expeller to recover β -carotene from carrot pomace obtained after carrot juice production. The optimal LLMs for the extraction was identified

via the HLD-NAC framework, and the predicted formulations confirmed via phase behavior studies. An expeller extraction method was developed and optimized for β -carotene yield, with respect to LLMs. The results suggest that the combination of expeller and LLMs extraction have 3-6 fold increase in β -carotene extraction as compared to other extraction methods. The optimal extraction is obtained with highly diluted LLMs, that lead to the lowest extraction costs. The LLMs containing extracted β -carotene were microencapsulated via spray-drying to extend shelf life and prevent the release of β -carotene at the stomach's pH.
