- **Sensory Dimension:** Words that describe the physical sensations of pain, such as throbbing, shooting, or stabbing.
- **Affective Dimension:** Words that reflect emotional responses to pain, like tiring, sickening, or fearful.

2. Pain Intensity Scales

Patients rate their current, worst, and average pain on a numerical scale, often from 0 (no pain) to 10 (worst imaginable pain).

3. Present Pain Description

A section where patients describe their current pain experience, including location, duration, and frequency.

4. Visual Analog Scale (VAS)

Some versions include a VAS, where patients mark their pain level on a 10 cm line, providing a visual measurement of pain intensity.

5. Quality Descriptors

A list of adjectives or descriptors that help patients articulate the nature of their pain, which can be selected or rated.

6. Summary and Scoring

The questionnaire provides a scoring system that quantifies pain across different dimensions, aiding in tracking progress or response to treatment.

mcgill pain questionnaire pdf: [Beyond Myalgic Encephalomyelitis/Chronic Fatigue Syndrome](#) Institute of Medicine, Board on the Health of Select Populations, Committee on the Diagnostic Criteria for Myalgic Encephalomyelitis/Chronic Fatigue Syndrome, 2015-03-16 Myalgic encephalomyelitis (ME) and chronic fatigue syndrome (CFS) are serious, debilitating conditions that affect millions of people in the United States and around the world. ME/CFS can cause significant impairment and disability. Despite substantial efforts by researchers to better understand ME/CFS, there is no known cause or effective treatment. Diagnosing the disease remains a challenge, and patients often struggle with their illness for years before an identification is made. Some health care providers have been skeptical about the serious physiological - rather than psychological - nature of the illness. Once diagnosed, patients often complain of receiving hostility from their health care provider as well as being subjected to treatment strategies that exacerbate their symptoms. *Beyond Myalgic Encephalomyelitis/Chronic Fatigue Syndrome* proposes new diagnostic clinical criteria for ME/CFS and a new term for the illness - systemic exertion intolerance disease(SEID). According to this report, the term myalgic encephalomyelitis does not accurately describe this illness, and the

term chronic fatigue syndrome can result in trivialization and stigmatization for patients afflicted with this illness. Beyond Myalgic Encephalomyelitis/Chronic Fatigue Syndrome stresses that SEID is a medical - not a psychiatric or psychological - illness. This report lists the major symptoms of SEID and recommends a diagnostic process. One of the report's most important conclusions is that a thorough history, physical examination, and targeted work-up are necessary and often sufficient for diagnosis. The new criteria will allow a large percentage of undiagnosed patients to receive an accurate diagnosis and appropriate care. Beyond Myalgic Encephalomyelitis/Chronic Fatigue Syndrome will be a valuable resource to promote the prompt diagnosis of patients with this complex, multisystem, and often devastating disorder; enhance public understanding; and provide a firm foundation for future improvements in diagnosis and treatment.

Nada Gligorov, 2016-09-23 This book is focused on the examination of the particular relationship between developments in neuroscience and commonsense concepts, such as free will, personal identity, privacy, etc., which feature prominently in moral discourse. In the book common sense is recast as an ever-shifting repository of theories from many domains, including science. Neuroethics is one of the newest, developing branches of Bioethics. Topics often raised include issues of free will, personal identity and the self; the possible ethical implication of memory manipulation; brain imaging and mind-reading; brain stimulation/enhancement and its impacts on personal identity; and brain death.
