rac maps route planner: Route Choice: Wayfinding in Transport Networks P.H. Bovy, E. Stern, 2012-12-06 With the ever increasing number of opportunities, in every aspect of modern life, making choices becomes part of our daily routine. It is thus only natural that social scientists have started to study human choice behavior. Early efforts focused on modeling aggregate choice patterns of home buyers, shoppers, travelers, and others. Later studies, aiming to achieve more realistic results, have concentrated on simulating disaggregate behavior. The most recent approach in choice research is the so-called Discrete Choice Modeling. It is a front-line area mainly in contemporary transportation, geography, and behavioral research. It focuses on individuals' decision-making processes regarding the choice of destinations, modes, departure times, and routes. Considerable research has been done on identifying and quantifying the general rules governing the individuals' choice behavior, but to the best of our knowledge there is no single book that solely deals with route choice. The study of travelers' route choice in networks is primarily oriented towards gaining insight into their spatial choice behavior. How do people choose routes in a network, what do they know, what do they look for, which road characteristics play a role? On the basis of this information it is possible to design quantitative models aimed at predicting the use of routes dependent on the characteristics of the routes, those of the surrounding environment, and those of the travelers. In this way, traffic flows in the network can be calculated and the network performance can be evaluated.

rac maps route planner: Cognitive and Linguistic Aspects of Geographic Space D.M.

Mark, Andrew U. Frank, 2012-12-06 This book contains twenty-eight papers by participants in the NATO Advanced Study Institute (ASI) on Cognitive and Linguistic Aspects of Geographic Space, held in Las Navas del Marqués, Spain, July 8-20, 1990. The NATO ASI marked a stage in a two-year research project at the U. S. National Center for Geographic Information and Analysis (NCGIA). In 1987, the U. S. National Science Foundation issued a solicitation for proposals to establish the NCGIA and one element of that solicitation was a call for research on a fundamental theory of spatial relations. We felt that such a fundamental theory could be searched for in mathematics (geometry, topology) or in cognitive science, but that a simultaneous search in these two seemingly disparate research areas might produce novel results. Thus, as part of the NCGIA proposal from a consortium consisting of the University of California at Santa Barbara, the State University of New York at Buffalo, and the University of Maine, we proposed that the second major Research Initiative (two year, multidisciplinary research project) of the NCGIA would address these issues, and would be called Languages of Spatial Relations. The grant to establish the NCGIA was awarded to our consortium late in 1988.
