x x x e: Rigvedic Formulas and Meter Urban Lindqvist, 2015-04-01 The book starts with a rundown on Rigvedic meter including a discussion of irregularities and the importance of word-boundary patterns, with a brief digression on clitics. This is followed by a discussion of formulas, formulaic diction and various definitions of the concept of formula in oral-poetic traditions, resulting in the relativistic but more realistic definition "a formula is a slice of a formulaic continuum", i.e. a razor-sharp definition is in conflict with the material it is supposed to define. The metrical facts show that irregular dimeters in the Rigveda are more closely related to regular trimeters than to regular dimeters. Still, Bloomfield's extraction hypothesis does not provide a sufficient methodological basis for explaining the irregular dimeters, nor does the laryngealist approach. A selection of irregular dimeter lines are examined with reference to the formulaic continua and associative networks surrounding them, and an attempt is made to show how these continua helped trigger the use of certain words in certain metrical positions.

The book is concentrated around a thorough presentation of the main macroeconomic medium-term models used in government planning and policy-making in each of the four countries. These models are: in Denmark, ADAM, developed by the Central Statistical Office, in Finland, KESSU, developed within the Ministry of Finance, in Norway, MODAG, developed by the Central Bureau of Statistics, and in Sweden, EMMA, developed within the Ministry of Finance. An introduction to Nordic macroeconomic models is provided, as well as significant features of the institutional use of models within governments in these countries. On the basis of the data presented in the book, the effects of devaluation, wage increases and fiscal policy in the Nordic economies can be compared with each other as well as with other small open economies.

Then, the relevant nonlinear integrals are investigated. These integrals can be applied as aggregation tools in information fusion and data mining, such as synthetic evaluation, nonlinear multiregressions, and nonlinear classifications. Some methods of fuzzification are also introduced for nonlinear integrals such that fuzzy data can be treated and fuzzy information is retrievable. The book is suitable as a text for graduate courses in mathematics, computer science, and information science. It is also useful to researchers in the relevant area.
