Understanding the Fulton Surface to Air Recovery System

What Is the Fulton Surface to Air Recovery System?

The Fulton Surface to Air Recovery System, often abbreviated as STARS, is a method of extracting personnel and cargo from the ground using an aircraft equipped with a specialized recovery apparatus. It was initially developed by the Fulton Engineering Company and later adopted by the United States military, especially the U.S. Air Force and Navy, during the 1950s and 1960s. This system allows helicopters or fixed-wing aircraft to capture a suspended personnel or cargo container from the ground—regardless of terrain or weather conditions—via a high-strength wire cable and a unique retrieval device known as the "Skyhook."

Historical Development and Origins

The origins of the Fulton Surface to Air Recovery System trace back to the Cold War period, where covert operations and rapid extraction became a strategic necessity. The system was named after Robert Fulton, an American engineer and inventor, though the connection is more nominal than functional. The real innovation lay in the development of the Skyhook and the associated recovery methods that could be mounted onto aircraft, enabling personnel to be retrieved from remote locations without the need for landing.

Initially, the system was used primarily for CIA covert missions, especially in Southeast Asia during the Vietnam War, where traditional landing zones were often unavailable or too dangerous. Over time, the technology was refined and incorporated into various military operations, demonstrating its effectiveness and versatility.

How Does the Fulton Surface to Air Recovery System Work?

Components of the Fulton System

The Fulton Surface to Air Recovery System comprises several critical components:

- Skyhook: A specialized, high-strength, swiveling hook that attaches to the personnel or cargo. It is designed to withstand significant loads and facilitate quick engagement and release.
- Recovery Cable: A strong, durable wire cable connecting the Skyhook to the aircraft. The cable length can vary but is typically designed for optimal reach and safety.
- Aircraft Mounting Hardware: The Skyhook and cable are mounted on the aircraft, usually on a retractable or fixed rig, compatible with helicopters or fixed-wing aircraft.
- Ground Equipment: A harness or harness system worn by personnel, which is connected to the Skyhook for retrieval.

Step-by-Step Operation Process

The operation of the Fulton system involves a precise sequence:

1. Preparation: The personnel to be retrieved wear a harness connected to the Skyhook. The aircraft approaches the designated pickup zone at a controlled speed and altitude.
2. Approach and Positioning: The aircraft aligns with the ground personnel or cargo, maintaining a steady hover or flight path.
3. Engagement: The Skyhook is lowered or extended towards the ground or personnel, then engaged by the personnel or cargo, which is secured via the harness.
4. Lifting: Once secured, the aircraft gently lifts off, retracting the cable and Skyhook, bringing the personnel or cargo into the aircraft.
5. Transport: The recovered personnel or cargo are transported to a safe zone or aircraft landing site for further processing.

This process allows rapid extraction without the need for landing, even in challenging environments like dense forests, urban terrains, or mountainous regions.

It revolutionized the way personnel could be recovered from hostile or inaccessible environments, especially in military and clandestine operations. This comprehensive review delves into the history, technical mechanics, operational procedures, advantages, limitations, and modern relevance of the Fulton system, providing a detailed understanding of this innovative aerial recovery method.

Historical Background and Development

Origins and Motivation

The Fulton system was conceived in the early 1950s amidst Cold War tensions when rapid personnel extraction from hostile or remote terrains became a strategic necessity. The U.S. Air Force, in collaboration with the Lockheed Corporation, sought a reliable and swift method to recover downed pilots or agents behind enemy lines without risking further exposure or delay.

Development and Deployment

- The system was developed in the early 1950s and operationalized by the U.S. Air Force and Navy.
- First publicly revealed in the late 1950s, it gained notoriety as a covert

extraction tool.

- The most famous aircraft equipped with STARS was the C-130 Hercules, modified to carry the recovery apparatus and personnel.

Operational Use Cases

- Extraction of downed pilots in hostile territories.
- Retrieval of espionage agents or operatives.
- Humanitarian evacuations in crisis zones.
- Covert military operations requiring rapid extraction.

Technical Mechanics of the Fulton Surface-to-Air Recovery System

Core Components

The Fulton system comprises several key components working in unison:

1. Balloon or Ballonet: An inflatable lifting device attached to the personnel or payload.
2. Lifting Device (Skyhook): A specialized hook suspended beneath the aircraft.
3. Recovery Harness: Worn by the personnel, connected to the balloon or lifting device.
4. Aircraft Modifications: Aircraft are fitted with a retractable or fixed "hook" and a hoist mechanism.

Step-by-Step Operational Process

The recovery process involves a series of coordinated steps:

1. Preparation and Approach:
 - The recovery aircraft approaches the target zone at a controlled altitude.
 - The personnel, often suspended in a harness or harness bag, are prepared for pickup.
2. Deployment of the Balloon and Skyhook:
 - The personnel are lifted into the air using a helium-inflated balloon or ballonet attached to their harness.
 - The balloon is guided to the aircraft's cargo hook system.
3. Hook Engagement:
 - The aircraft maneuvers to align its skyhook with the balloon or harness

assembly.

- The skyhook, attached via a cable, is lowered to engage the balloon or harness.

4. Lift and Retrieval:

- Once engaged, the aircraft's hoist mechanism lifts the personnel into the cargo bay.
- The process is rapid, often completed within minutes.

5. Retrieval and Recovery:

- After personnel are secured, the balloon is deflated or detached.
- The aircraft departs the area for debriefing, medical aid, or further operations.

Technological Innovations

- The Skyhook system is designed for quick engagement and disengagement.
- Use of helium balloons ensures lift without electrical power.
- Aircraft modifications include reinforced hooks and hoist systems capable of handling dynamic loads.

Operational Considerations and Techniques

Combat Talons in Vietnam is a personal account of the first use of C-130s in the Vietnam War. It provides an insider's view of crew training and classified missions for this technologically advanced aircraft. Many covert missions over North Vietnam were successful, but one night, John Gargus, a mission planner, oversaw an operation in which the aircraft—carrying eleven crewmembers—failed to return from a nighttime mission. For thirty years, a search for the missing aircraft remained in progress. In the late 1990s, the Combat Talon veteran community at Hurlburt Field in Florida, still uncertain of the full story, decided to dedicate a memorial to the lost crew. When wartime mission records were declassified, Gargus embarked on a long journey of inquiry, research, and puzzle-solving to reconstruct the events of that mission and the fate of its crew. He discovered that the wreckage of the plane had been found in 1992 and that the remains of the crew were being held in Hawaii. Through numerous Freedom of Information Act requests, interviews, and site visits, Gargus sought to answer the question of why it took so long to find the wreckage and, more importantly, why the special operations command units were left uninformed. By 2000, the remains were relocated to a common grave at Arlington National Cemetery at last providing a measure of closure to family, friends, and comrades.

Uncommon Valor is a look into the formation and operation of an advanced Special Forces recon company during the Vietnam War. Code-named the Studies and Observations Group, SOG was the most covert U.S. military unit in its time and contained only volunteers from such elite units as the Army's Green Berets, Navy SEALs, and Air Force Air Commandos. SOG warriors operated in small teams, going behind enemy lines in Laos and Cambodia and along the Ho Chi Minh Trail, tasked with performing special reconnaissance, sabotaging North Vietnamese Army ammunition, attempting to rescue downed U.S. pilots, and other black ops missions. During that time, Forward Operating Base-2's (FOB-2's) recon company became the most highly decorated unit of the Vietnam War, with five of its men earning the Medal of Honor and eight earning the Distinguished Service Cross-America's second highest military award for valor. Purple Hearts were earned by SOG veterans at a pace unparalleled in American wars of the twentieth century, with casualties at times exceeding 100 percent. One, Bob Howard, was wounded on fourteen different occasions, received eight Purple Hearts, was written up after three different missions for the Medal of Honor, and emerged from Vietnam as the most highly decorated soldier since World War II's Audie Murphy.
