Item) Using the Beck Anxiety Inventory and the Structured Interview Guide for the Hamilton Anxiety Scale Elizabeth Ann Tammen, 2008 Anxiety disorders are a pervasive problem in our world, afflicting millions of people. The high prevalence of anxiety disorders clearly points to the necessity of developing valid and reliable measures of anxiety for accurate assessment and treatment of this disorder. A variety of checklists and rating scales have been developed in recent years to meet the critical need for accurate anxiety measurement. Two of these measures, the Beck Anxiety Inventory (BAI) and the Structured Interview Guide for the Hamilton Anxiety Scale (SIGH-A) are well established and widely used instruments for measuring anxiety symptoms, demonstrating good validity and reliability.

The high prevalence of anxiety disorders clearly evidences a necessity for valid and reliable assessment instruments for researchers and clinicians. In recent years, a variety of checklists and rating scales have emerged that assess for the presence of anxiety symptoms. Two of these instruments, the Beck Anxiety Inventory and the Burns Anxiety Inventory, constitute two widely used and well researched self-report scales for measuring anxiety symptoms. Both of these instruments demonstrate good reliability and validity. The purpose of the present study was to evaluate the concurrent validity of the Burns Anxiety Inventory-Revised, a recently developed self-report measure for anxiety for which there is a paucity of validity research. This was accomplished by correlating scores on the Burns Anxiety Inventory-Revised using a sample of 100 undergraduate participants. The correlations found among these inventories resulted in statistically significant correlation coefficients, suggesting that the Burns Anxiety Inventory-Revised is a valid measure of anxiety. Additionally, the Burns A-R demonstrated high item intercorrelation suggesting the instrument is a homogenous scale.

This was accomplished by correlating scores on the Mind Over Mood Anxiety Inventory with scores on the Beck Anxiety Inventory and the Burns Anxiety Inventory using a sample of 104 undergraduate participants. The correlations found among these inventories resulted in statistically significant correlation coefficients, suggesting that the Mind Over Mood Anxiety Inventory is a valid measure of anxiety. Additionally, the MOM-A demonstrated high item intercorrelation, suggesting the instrument is a homogeneous scale.
