ph analysis gizmo: Mind as Machine Margaret A. Boden, 2006 Cognitive science is among the most fascinating intellectual achievements of the modern era. The quest to understand the mind is an ancient one. But modern science has offered new insights and techniques that have revolutionized this enquiry. Oxford University Press now presents a masterly history of the field, told by one of its most eminent practitioners. Psychology is the thematic heart of cognitive science, which aims to understand human (and animal) minds. But its core theoretical ideas are drawn from cybernetics and artificial intelligence, and many cognitive scientists try to build functioning models of how the mind works. In that sense, Margaret Boden suggests, its key insight is that mind is a (very special) machine. Because the mind has many different aspects, the field is highly interdisciplinary. It integrates psychology not only with cybernetics/AI, but also with neuroscience and clinical neurology; with the philosophy of mind, language, and logic; with linguistic work on grammar, semantics, and communication; with anthropological studies of cultures; and with biological (and A-Life) research on animal behaviour, evolution, and life itself. Each of these disciplines, in its own way, asks what the mind is, what it does, how it works, how it develops---and how it is even possible. Boden traces the key questions back to Descartes's revolutionary writings, and to the ideas of his followers--and his radical critics--through the eighteenth and nineteenth centuries. Her story shows how controversies in the development of experimental physiology, neurophysiology, psychology, evolutionary biology, embryology, and logic are still relevant today. Then she guides the reader through the complex interlinked paths along which the study of mind developed in the twentieth century. Cognitive science covers all mental phenomena: not just 'cognition' (knowledge), but also emotion, personality, psychopathology, social communication, religion, motor action, and consciousness. In each area, Boden introduces the key ideas and researchers and discusses those philosophical critics who see cognitive science as fundamentally misguided. And she sketches the waves of resistance and acceptance on the part of the media and general public, showing how these have affected the development of the field. No one else could tell this story as Boden can: she has been a member of the cognitive science community since the late-1950s, and has known many of its key figures personally. Her narrative is written in a lively, swift-moving style, enriched by the personal touch of someone who knows the story at first hand. Her history looks forward as well as back: besides asking how state-of-the-art research compares

with the hopes of the early pioneers, she identifies the most promising current work. *Mind as Machine* will be a rich resource for anyone working on the mind, in any academic discipline, who wants to know how our understanding of mental capacities has advanced over the years.

ph analysis gizmo: [Our Patchwork Nation](#) Dante Chinni, James Gimpel Ph.D., 2011-10-04 A revolutionary new way to understand America's complex cultural and political landscape, with proof that local communities have a major impact on the nation's behavior-in the voting booth and beyond. In a climate of culture wars and tremendous economic uncertainty, the media have often reduced America to a simplistic schism between red states and blue states. In response to that oversimplification, journalist Dante Chinni teamed up with political geographer James Gimpel to launch the Patchwork Nation project, using on-the-ground reporting and statistical analysis to get past generalizations and probe American communities in depth. The result is *Our Patchwork Nation*, a refreshing, sometimes startling, look at how America's diversities often defy conventional wisdom. Looking at the data, they recognized that the country breaks into twelve distinct types of communities, and old categories like soccer mom and working class don't matter as much as we think. Instead, by examining Boom Towns, Evangelical Epicenters, Military Bastions, Service Worker Centers, Campus and Careers, Immigration Nation, Minority Central, Tractor Community, Mormon

Outposts, Emptying Nests, Industrial Metropolises, and Monied Burbs, the authors demonstrate the subtle distinctions in how Americans vote, invest, shop, and otherwise behave, reflect what they experience on their local streets and in their daily lives. Our Patchwork Nation is a brilliant new way to debate and examine the issues that matter most to our communities, and to our nation.

ph analysis gizmo: Capitalism and Natural Law Robert McGrath Ph.D., 2018-01-04 The author begins with the statement Christianity and Capitalism both seem to be going through a bit of a rough patch at the time of writing. Each of these concerns is enough to motivate a book, but Robert N. McGrath, PhD, is concerned about the nexus of the two. He begins with the observation that many people cannot articulate a clear understanding of either capitalism or natural law. First, capitalism means more than free enterprise. Capitalism is first a theory of economics where capital is accumulated, allocated, and managed productively in order to increase the economic welfare of society. Such a theory is an outgrowth of centuries of philosophy. Second, natural law theology goes back to ancient Greek and Roman philosophers, but evolved with Christian doctrine to become central to that faith's present theology. In the meantime, people such as Thomas Aquinas, John Locke, and Thomas Jefferson ensconced it deeply into the very psyche of Western civilization and its philosophy, including economic thought. After explaining this, the author examines original words of eminent modern economists since Adam Smith, into the twentieth century with Joseph Schumpeter, the very champion of entrepreneurship as being the essence of capitalism. Several interim-period economists also implied that economic laws are natural, while others have been adamantly and even violently opposed to any such view. However, the author continuously insists that his purpose is to be provocative, not definitive, and leaves final interpretations largely to each reader.

ph analysis gizmo: Desperately Seeking the Audience Ien Ang, 2006-06-28 Millions of people all over the world are avid members of the television audience. Yet, despite the central place television occupies in contemporary culture, our understanding of its complex and dynamic role in everyday life remains surprisingly limited. Focusing on the television audience, Ien Ang asks why we understand so little about its nature, and argues that our ignorance arises directly out of the biases inherent in prevailing official knowledge about it. She sets out to deconstruct the assumptions of this official knowledge by exploring the territory where it is mainly produced - the television institutions. Ang draws on Foucault's theory of power/knowledge to scrutinize television's desperate search for the audience, and to identify differences and similarities in the approaches of American commercial television and European public service television to their audiences. She looks carefully at recent developments in the field of ratings research, in particular the controversial introduction of the 'people meter' as an instrument for measuring the television audience. By defining the limits and limitations of these institutional procedures of knowledge production, Ien Ang opens up new avenues for understanding television audiences. Her ethnographic perspective on the television audience gives new insights into our television culture, with the audience seen not as an object to be controlled, but as an active social subject, engaging with television in a variety of cultural and creative ways.
