durable paint for cave walls, and over the next 70 thousand years or so as civilizations took hold around the globe, people learned to make better medicines and discovered how to extract, mix, and smelt metals for cooking vessels, weapons, and jewelry. Early chemists distilled perfume, made soap, and perfected natural inks and dyes. Modern chemistry was born around 250 years ago, when measurement, mathematics, and the scientific method were officially applied to experimentation. In 1896, after the first draft of the periodic table was published, scientists rushed to fill in the blanks. The elemental discoveries that followed gave scientists the tools to visualize the building blocks of matter for the first time in history, and they proceeded to deconstruct the atom. Since then, discovery has accelerated at an unprecedented rate. At times, modern chemistry and its creations have caused heartbreaking, unthinkable harm, but more often than not, it makes our lives better. With this fascinating, hands-on exploration of the history of chemistry, inspire the next generation of great scientists.

periodic table for kids: Teaching Kids to Think Critically Clifton Chadwick, 2014-09-12 This book is based on a simple series of psychological concepts. While ability to think has always been important, the knowledge economy significantly increases the demand for higher order thinking and problem-solving abilities. Parents should take a much more active role in teaching their children to think. Early preschool years are critical because long-term attitudes and early strategies are learned then. Approaches and perspectives on learning to think can be clearly communicated to parents in ways which will make it possible for them to use the correct strategies to stimulate their students to think more clearly and critically. There are five elements involved in good, logical, critical, and creative thinking: 1. The skills involved in effective, efficient, and lasting learning, or commonly referred to as cognitive processing strategies 2. The mastery of logic and structure of what is being learned 3. Awareness of what one knows and does not know, and how one knows and how one thinks 4. The standards or guidelines for the validity and reliability of what one knows, called intellectual standards 5. The knowledge and skills involved in critical thinking and solving problems in different subjects or domains
