the flow country map: Deep Map Country Susan Naramore Maher, 2014-05-01 Taking its name from the subtitle of William Least Heat-Moon's *PrairieErth* (a deep map), the "deep-map" form of nonfiction and environmental writing defines an innovative and stratigraphic literary genre. Proposing that its roots can be found in Great Plains nonfiction writing, Susan Naramore Maher explores the many facets of this vital form of critique, exploration, and celebration that weaves together such elements of narrative as natural history, cultural history, geography, memoir, and intertextuality. Maher's *Deep Map Country* gives readers the first book-length study of the deep-map nonfiction of the Great Plains region, featuring writers as diverse as Julene Bair, Sharon Butala, Loren Eiseley, Don Gayton, Linda Hasselstrom, William Least Heat-Moon, John Janovy Jr., John McPhee, Kathleen Norris, and Wallace Stegner. *Deep Map Country* examines the many layers of storytelling woven into their essays: the deep time of geology and evolutionary biology; the cultural history of indigenous and settlement communities; the personal stories of encounters with this expansive terrain; the political and industrial stories that have affected the original biome and Plains economies; and the spiritual dimensions of the physical environment that press on everyday realities.

the flow country map: Conquering the Highlands Jan Oosthoek, 2013-02-01 Deforestation of Scotland began millennia ago and by the early 20th century woodland cover was down to about 6 per cent of the total land area. A century later woodland cover had tripled. Most of the newly established forestry plantations were created on elevated land with wet peaty soils and high wind exposure, not exactly the condition in which forests naturally thrive. Jan Oosthoek tells in this book the story of how 20th century foresters devised ways to successfully reforest the poor Scottish uplands, land that was regarded as unplantable, to fulfil the mandate they had received from the

Government and wider society to create a timber reserve. He raises the question whether the adopted forestry practice was the only viable means to create forests in the Scottish Highlands by examining debates within the forestry community about the appearance of the forests and their longterm ecological prospects. Finally, the book argues that the long held ecological convictions among foresters and pressure from environmentalists came together in the late 20th century to create more environmentally sensitive forestry.

the flow country map: Introduction to Geological Maps and Structures John L. Roberts, 2013-10-22 *Introduction to Geological Maps and Structures* describes the basic methods to interpret and attain a better understanding of geological maps. The book describes the nature and

preparation of geological maps, and then covers topics such as solid and drift maps, geological boundaries, sections, and the use of symbols. The book explains sedimentary rocks, outcrop patterns, and the topographic representation of geological structures. The text also addresses the geometry of folds and folding when pre-existing surfaces are distorted into zigzag patterns. The author explains in detail the morphology of folded layers and the mechanism involved in folding. He goes on to interpret the formation of outcrop patterns, as well as the structure of a cylindrical and cylindroidal fold patterns. The author also describes the different structures that result from the brittle fractures present in rocks that undergo massive stress. Of interest is the presentation of how fissures and mineral veins are formed and deposited. The author then discusses earth movements resulting in angular unconformities known as stratigraphic break. These breaks in the stratigraphic record, such as diastems, non-sequences, paraconformities, or disconformities, can be interpreted as the intervals of geological time. The book then explains the nature of tectonic maps, which involves features arising from the continental crust, and how these maps are different from geological maps that show the outcrop of lithostratigraphic units. Geologists, cartographers, meteorologists, seismologists, land use developers, and students of the earth sciences will find this book valuable.

the flow country map: **Scotland's North Highlands (Slow Travel)** Emma Gibbs, 2025-02-07 Scotland's North Highlands (Slow Travel) is the latest title in Bradt's series of distinctive, widely acclaimed 'Slow' travel guides to local UK regions. Written by a northern Scotland specialist who edits the award-winning JRNY Travel Magazine, this guidebook provides greater detail than any other to the whole of northern Scotland - roaming far beyond the increasingly popular 516-mile North Coast 500 (NC500) driving route. Coupling a wide, personal selection of places to explore with focused advice on travel practicalities, Scotland's North Highlands (Slow Travel) encourages visitors to adopt a leisurely approach designed to tease out the region's many special qualities - and contribute positively to local communities. In the far northern reaches of Scotland, Sutherland, Caithness and Ross-shire are regions that, by their very nature, demand to be taken slowly. Single-track roads dominate, skirting lochs and winding up and over moorland and mountains carpeted with blanket bog, settlements are few and far between, and you'll often feel outnumbered by sheep as yet another flock ambles across a road leading to a crumbling castle, old fishing port or alluring ancient site. But biding your time is no inconvenience here, not when every corner reveals a yet more staggering view, when remote coastal cliffs throb with the cries of seabirds, or when following a sign down a potholed road leads to an empty cove of sand that shimmers pink and blue in

the ever-changing Highlands light. There are no large settlements here – the second-largest town has barely 1,500 inhabitants – so visitors focus very much on the outdoors. Getting into wilderness is joyously easy: within moments of parking your car or stepping out of your B&B, you're striding among scenery so enchanting and dramatic it feels like it's been conjured up by someone's imagination. Whether you crave clambering over rocks to discover secret beaches, watching dolphins leap, kayaking to uninhabited islands or trekking to the UK's highest waterfall, northern Scotland is the kind of place that gets its teeth into you – a place that people return to again and again. Just the place, indeed, for Bradt's Scotland's North Highlands to provide the perfect travelling companion.
