Bassetti, 2010-01-01 The third part of Neurological Disorders in Famous Artists presents painters, musicians, and writers who had to fight against an acute or chronic neurological disease. Sometimes this fight was without success (e.g. Shostakovich, Schumann, Wolf, Pascal), but often a dynamic and paradoxical creativity of the clinical disorder was integrated into their artistic production (e.g. Klee, Ramuz). Occasionally, some even wrote the first report of a medical condition they observed in themselves, like Stendhal who made a detailed report of aphasic transient ischemic attacks before dying of stroke shortly thereafter. In rarer instances, a neurological disease was inaccurately attributed to an artist in order to explain certain features of his work (de Chirico, Schiele). Some chapters in this publication focus on neurological conditions

reported in artistic work, including descriptions by Shakespeare and Dumas. Bringing new light to both artists and neurological conditions, this book serves as a valuable and entertaining read for neurologists, psychiatrists, physicians, and anybody interested in arts, literature and music.

Cognitive neuroscience, once a specialized area of psychology and biology, has enjoyed increased worldwide legitimacy in the last thirty years not only in psychiatry and mental health, but also in fields as diverse as education, economics, marketing, and law. How can this surge in popularity be explained? Has the new science of human behaviour now become the barometer of our conduct and our lives, taking the place previously occupied by psychoanalysis? Rather than asking if neuronal man will replace social man or how to surmount the opposition between the biological and the social, *The Mechanics of Passions* uncovers hidden relationships between global social ideals and specialized concepts of neuroscience and cognitive science. Proposing a historical sociology situated in the dual contexts of the history of sciences and the history of self-representation, Alain Ehrenberg describes the conditions through which cognitive neuroscience has developed and acquired a strong moral authority in our individualistic society permeated by ideas, values, and norms of autonomy. Cognitive neuroscience offers the promise of turning personal limitations into assets by exploring an individual's hidden potential. *The Mechanics of Passions* identifies this as the echo of social ideals of autonomy, affirming that the moral authority of cognitive neuroscience stems as much from cultural norms as from any results of scientific or medical experimentation.
