map of baltic sea: *Coastal and Marine Geo-Information Systems* David R. Green, Stephen D. King, 2006-04-11 The emphasis now placed on the concept of sediment cells as boundaries for coastal defence groups, and the development of SMPs, should help CPAs realise the importance of natural processes at the coast when designing defence and protection schemes. However, this will only be the case where defence groups exist, and where CPAs take up the challenge of developing SMPs. Coastal landscapes have been produced by the natural forces of wind, waves and tides, and many are nationally or internationally important for their habitats and natural features. Past practices at the coast, such as the construction of harbours, jetties and traditional defence systems may have contributed to the deterioration of the coast. English Nature (1992) have argued that if practices and methods of coastal defence are allowed to continue, then coastlines would be faced with worsening consequences, including: The loss of mudflats and the birds which live on them Damage to geological Sites of Special Scientific Interest (SSSIs) and scenic heritage by erosion, due to the stabilisation of the coast elsewhere Cutting of sediment supplies to beaches resulting in the loss of coastal wildlife Cessation through isolation from coastal processes, of the natural operation of spits, with serious deterioration of rare plants, animals and geomorphological and scenic qualities (English Nature, 1992) A number of designations, provided by national and international legislation do exist to aid conservation.

The countries regained independence in 1991 following the disintegration of the Soviet Union. They sought to secure themselves by joining the EU, NATO and the Eurozone. They are robust democracies registering steady economic growth with improved living standards and are leading hubs in the field of Information Technology. However, for these small states bordering Russia the ongoing Russia-Ukraine war brings existential fears. This volume analyses how these states with substantial number of Russian minorities are recalibrating their policies in this changing geopolitical landscape of an assertive and aggressive Russia. It provides an in-depth understanding of the Baltic countries focusing on their security concerns, regional cooperation, gender and minority issues and bi-lateral relations with emerging powers China and India. The volume would be of immense value to scholars of International Relations, academics, journalists,

researchers and policy makers.

It also presents the development of processes to map, harmonize and integrate marine data across EEZ boundaries, an impressive example of which is the European EMODnet (European Marine Observation and Data network) initiative. EMODnet assembles scattered and partially hidden marine data into continentally harmonized geospatial data products for public benefit and increasingly within overseas collaboration. The volume also aims to shed light on an evaluation of biological and mineral resources and environmental assessments at continental shelf to slope depths. Western Pacific examples provide excellent case studies for this topic. Mapping of the ocean realm is not only for scientific purposes, but also for the people who live by the seas. Communication amongst scientists and multiple stakeholders is essential for living sustainably with the seas. In this volume we encourage dialogue amongst all the stakeholders.

map of baltic sea: Mental Maps Janne Holmén, Norbert Götz, 2021-11-28 The concept of mental maps is used in several disciplines including geography, psychology, history, linguistics, economics, anthropology, political science, and computer game design. However, until now, there has been little communication between these disciplines and methodological schools involved in mental mapping. *Mental Maps: Geographical and Historical Perspectives* addresses this situation by bringing together scholars from some of the related fields. Ute Schneider examines the development of German geographer Heinrich Schiffrers' mental maps, using his books on Africa from the 1930s to the 1970s. Efrat Ben-Ze'ev and Chloé Yvroux investigate conceptions of Israel and Palestine, particularly the West Bank, held by French and Israeli students. By superimposing large numbers of sketch maps, Clarisse Didelon-Loiseau, Sophie de Ruffray, and Nicolas Lambert identify soft and hard macro-regions on the mental maps of geography students across the world. Janne Holmén investigates whether the Baltic and the Mediterranean Seas are seen as links or divisions between the countries that line their shores, according to the mental maps of high school seniors. Similarly, Dario Musolino maps regional preferences of Italian entrepreneurs. Finally, Lars-Erik Edlund offers an essayistic account of mental mapping, based on memories of maps in his own family. This edited volume book uses printed maps, survey data and hand drawn maps as sources, contributing to the study of human perception of space from the perspectives of different disciplines. The chapters in this book were originally published as a special issue of the *Journal of Cultural Geography*.
