Understanding the Phases of the Moon

What Are the Phases of the Moon?

The phases of the moon refer to the different appearances of the moon as seen from Earth, caused by the relative positions of the Earth, moon, and sun. As the moon orbits our planet, the angle of sunlight illuminating its surface changes, resulting in the distinctive phases we observe. These phases are cyclical and repeat approximately every 29.5 days, forming the lunar month.

The Eight Main Phases

The lunar cycle is traditionally divided into eight main phases, each with its own visual and symbolic characteristics:

1. New Moon

The moon is positioned between the Earth and the sun, making the illuminated side face away from us. It appears invisible in the night sky.

2. Waxing Crescent

A sliver of the moon becomes visible as the illuminated part increases, creating a crescent shape on the right side.

3. First Quarter

Also called the half-moon, half of the moon's surface is illuminated on the right side, and it appears as a perfect half circle.

4. Waxing Gibbous

More than half of the moon is illuminated, growing toward a full moon appearance.

5. Full Moon

The moon is on the opposite side of the Earth from the sun, fully illuminated and appearing as a complete circle.

6. Waning Gibbous

After the full moon, the illumination decreases, but more than half is still visible.

7. Last Quarter

Also known as the third quarter, the left half of the moon is illuminated, again appearing as a half-circle.

8. Waning Crescent

The illuminated portion continues to diminish, leaving a crescent shape on the left side.
