Common Types of Problems in Stoichiometry Worksheet 2

1. Mole-Mole Conversions

These problems involve converting quantities of one substance to another based on the balanced chemical equation. For example:

- Given the amount of reactant A in moles, determine the amount of product B formed.
- Convert grams of a substance to moles before calculating the amount of another substance.

2. Mass-to-Mass Calculations

Questions that require converting grams of reactant to grams of product using molar masses and mole ratios. Example:

- How many grams of product are produced from a given mass of reactant?

3. Limiting Reactant Problems

Identify which reactant limits the amount of product formed, and calculate the maximum yield based on that limiting reactant.

4. Percent Yield and Theoretical Yield

Calculate the theoretical yield based on stoichiometry and compare it with the actual yield to find the percent yield.

Sample Problem with Step-by-Step Solution

Let's explore a typical problem you might find in the worksheet, along with its detailed answer.

Problem:

Given 10 grams of hydrogen gas (H_2) and excess oxygen (O_2), how many grams of water (H_2O) can be produced?

Solution:

Step 1: Write the balanced chemical equation.

Step 2: Convert grams of H_2 to moles.

- Molar mass of H_2 = 2. g/mol
- Moles of H_2 = $10 \text{ g} / 2 \text{ g/mol} = 5 \text{ mol}$

Step 3: Use the mole ratio from the balanced equation.

- From the equation, 2 mol H_2 produce 2 mol H_2O .
- Moles of H_2O produced = $5 \text{ mol H}_2 \times (2 \text{ mol H}_2\text{O} / 2 \text{ mol H}_2) = 5 \text{ mol H}_2\text{O}$

Step 4: Convert moles of H_2O to grams.

- Molar mass of H_2O = 18 g/mol
- Grams of H_2O = $5 \text{ mol} \times 18 \text{ g/mol} = 90 \text{ g}$

Answer: 90 grams of water can be produced from 10 grams of hydrogen gas with excess oxygen.
