The concept of open data as we know it today is the result of many different initiatives, both of a legislative and non-legislative nature, and promoted by a wide range of actors. Numerous regulatory antecedents to foster the concept of open data and embed it in national and international policy agendas have been undertaken on both sides of the Atlantic, as well as at a supranational level. The book highlights a number of the efforts made to promote open data in Europe, Asia and the United States. In addition to new insights, practical guidance and multiple disciplinary perspectives on open data, the book also addresses the transformation of current developments towards open data, which may be referred to as the democratisation of data. This book will support open data practitioners as well as open data scholars in their endeavours to promote open data implementation and research. Bastiaan van Loenen is associate professor and director of the Knowledge Centre Open Data at the Faculty of Architecture and The Built Environment of Delft University of Technology in the Netherlands, as is Glenn Vancauwenberghe, who is a post-doctoral researcher, and Joep Cromptvoets is a professor at the Public Governance Institute of the KU Leuven in Belgium.

deloitte case study pdf: The Digitalization of Indonesian Small and Medium Enterprises Trina Fizzanty, Ikbāl Maulana, 2024-02-29 This book examines the digitalization of Small and Medium Enterprises (SMEs) in Indonesia and its challenges in the context of an emerging economy and the Covid-19 crisis. During the Covid-19 pandemic, business digitalization became a must for a business to avoid collapse and people saw that digital transformation is a panacea for SMEs to help them survive and revive from the crises. Governments and other stakeholders in many countries including Indonesia have launched policies and programs to support SMEs. Transforming SMEs' conventional businesses into digitalized versions, however, is a complex issue influenced by various factors. These factors encompass both internal changes within the organization and external dynamics in the ecosystem in which they operate. This book, therefore, is a new approach towards understanding the digitalization of SMEs in Indonesia and includes contributions from scholars with different, multi-disciplinary perspectives and demonstrates that digital transformation of SMEs is not all about technology adoption but also involves other aspects such as social, economic, and public governance factors. It discusses opportunities and challenges of digital transformation of SMEs in Indonesia, such as digital talent, financial inclusion, platform capitalism, automation, government's role, governance, open competition, and inclusive digital economy. The book is of interest to researchers and students of social economics, SMEs and entrepreneurship, human capital research, and economy and governance.

deloitte case study pdf: Building Resilience Sri Sekar, Kyle Lundin, Christopher Tucker, Joe Figueiredo, Javier Aguilar, 2019-05-31 A sustainable path to development has profound

consequences for all economic activities and related policies. The mining industry, which provides input to almost every product and service in the world, is highly relevant to the goal of achieving sustainable development in mineral-rich countries and in the global economy. In addition, environmental sustainability is a critical concern for mining companies, whose growth is increasingly affected by climate change. Given the centrality of minerals and metals to our way of living, *Building Resilience: A Green Growth Framework for Mobilizing Mining Investment* investigates the extent to which the mining industry can contribute to green growth. Despite what ought to be a tight nexus of public and private interest in targeted green sector investment, this report finds that there is a misalignment between mining companies' investment in climate-sensitive production processes, and policy makers' efforts to develop a cohesive green economy framework for industry to navigate. The private and public sectors regard the climate agenda and the development of local economic opportunity as separate matters. Neither industry nor government have yet to effectively leverage their climate imperatives and mandates to seize green growth opportunities. To address this misalignment, this report proposes a framework to help mining companies and governments integrate climate change and local economic opportunity activities. Going further, the report offers examples of projects and policies that support green growth: particularly climate-related activities that create scalable economic value and invest in long-lasting green infrastructure.

deloitte case study pdf: Towards applying a green infrastructure approach in the Gauteng City-Region Christina Culwick, Samkelisiwe Khanyile, Kerry Bobbins, Stuart Dunsmore, Anne Fitchett, Lerato Monama, Raishan Naidu, Gillian Sykes, Jennifer van den Bussche, Marco Vieira, 2019-12-11 In the context of heightened climate variability, thinking about ways to redesign our urban areas with more sustainable infrastructure solutions is becoming more and more important. Green infrastructure (GI) is emerging as an alternative approach to traditional ('grey') infrastructure in urban planning and development. Its emergence can be understood in terms of the growing demand for infrastructure and services, increased concerns over natural resource constraints and climate change, and the negative impacts associated with traditional approaches to designing and building cities. It has been proposed that GI can provide the same services as traditional infrastructure at a similar capital cost, while also providing a range of additional benefits. However, despite the increasing examples of successful urban GI applications, traditional infrastructure continues to dominate due to the lack of systematic evidence to support GI implementation. As a result, there has been an increase in calls from policy- and decision-makers for a greater evidence base on the benefits of GI, as well as for practical guidelines on its implementation. 'Towards applying a green infrastructure approach in the Gauteng City-Region' is the GCRO's third report in its ongoing research into 'Green assets and infrastructure'. The first two reports in this project series were more theoretically grounded and policy-oriented, whereas this third report is more practical in nature. The first report explored the basic principles around GI, assessed the extent of ecological features in Gauteng and the way governments in the province think about planning and maintenance of green assets. The second report responded to some of the

challenges identified in the first report, and in particular the importance of government officials and practitioners in exploring how international green infrastructure plans could be applied in the Gauteng context. This third report builds on the findings of the aforementioned reports and the project's CityLab series, which highlighted the need to build an evidence base as critical for garnering support for and as well as enhancing investment in the GI approach. Unlike the more theoretically grounded earlier reports, this report comprises four technical sections and practical reflections on how a GI approach could be incorporated into urban planning in the GCR and in other similar urban contexts.

deloitte case study pdf: Digital technologies in the grain sector of Ukraine Prikhodko, D., Sikachyna, O., Pedersen, E., Sylvester, G., Rybchynshyi, R., 2022-08-29 Comprising 30 percent of agricultural output and with an area of 15 million hectares, the grain sector is a pillar of Ukraine's agriculture. In 2020 Ukraine exported USD 9.4 billion worth of cereals, the second largest exporter after the United States of America, making Ukraine a major contributor to global food security. Using extensive interviews, the report assesses the extent to which Ukrainian farmers have adopted digital technologies, the many barriers to them doing so and the considerable opportunities these technologies present, while offering sharp insights into their potential contribution and how best to sustain them. The report also considers the level of interest larger farmers have in adopting precision agriculture technologies, and their benefits in terms of improved productivity, lower costs and reduced greenhouse gas emissions, despite the relatively high initial investment required. It concludes with a list of recommended actions, calling on four groups to embrace digital technologies and thus develop and transform Ukraine's grain sector: the private sector, financial institutions, the public sector and international organizations. This publication is part of the Country Investment Highlights series under the FAO Investment Centre's Knowledge for Investment (K4I) programme.

deloitte case study pdf: When Numbers Don't Add Up Faisal Sheikh, 2020-12-02 The author contextualized the phenomenon of accounting fraud using a framework he developed called "Corporate Governance Cosmos." The book contains an extensive literature review including an evaluation of the seminal theory in this area, namely, the Fraud Triangle. There is a comprehensive exploration of the motivations for accounting fraud and a growing realization that Dark Triad (psychopathy, narcissism, and machiavellianism) tendencies may explain why executives engage in accounting fraud. The author expands an established framework entitled Cooks Recipes Incentives Monitoring End results (C R I M E) by Rezaee (2005), to "C R I M E L", where L is the "Learning" from 33 international case studies of accounting fraud. Accountants, auditors, antifraud practitioners, and graduate students will find the case studies of accounting fraud particularly useful as it makes the phenomenon tangible and more understandable. The penultimate chapter is a study of the likely impact of financial technology on accounting fraud. The author concludes by marshalling various insights including a brief discussion of ethics, forwarding his International Code of Ethics for Professional Accountants (IFAC) "Ethical Triangle", his vision for the future accountant, which he refers to as "accounting engineers", and an ancient prescription for the curse of accounting fraud.

deloitte case study pdf: *Business Process Management: Current Applications and the Challenges of Adoption* Renata Gabryelczyk, Tomislav Hernaus, 2020-01-01 Business Process Management (BPM) has been evolving for over 25 years in information systems research, management science, and organizational practice (Vom Brocke & Mendling, 2018). The earliest characteristics of BPM concentrated around process analysis, improvement and control, in a less strict manner that required reengineering (Elzinga, Horak, Lee, & Bruner, 1995). More mature approaches, observed since the year 2000, have been promoting the so-called process thinking, i.e. managing an organization from a process-based point of view. These approaches emphasize that

process and team work oriented organizational structures should be aligned with other management systems. Process management should be holistic by its nature so as to cover an entire organization. Although BPM researchers stressed the need for system thinking at that time, published literature distinguished two perspectives of looking at BPM: the organizational perspective and the technological perspective of BPM. From the organizational perspective, authors focused on a number of key factors, i.e., process governance, a process-based organizational structure concept, customer orientation of internal and external processes, managing an organization based on process outputs, building process relations, and improving process maturity throughout the customer value chain, as well as through strategically aligning process initiatives to organizational objectives. From the technological perspective, the key factors of interest to authors, referred to as BPMS (Business Process Management System), include IT methods, techniques and tools that support the designing, implementation, modeling and simulation of business processes and are considered to be an extension of classical workflow systems or an environment for designing management support IT systems, e.g. ERP class systems. An integrated and interdisciplinary approach was proposed in the framework of six core BPM elements required for the holistic and sustainable use of process management (Rosemann & Vom Brocke, 2010). These include strategic alignment, governance, methods, information technology, people and culture. In this sense, technology is only one of six closely interrelated elements. Currently, there are two distinct directions in the evolution of BPM: traditional BPM and digital BPM. The former encompasses methods, techniques and systems that traditionally lead to increased organizational efficiency and to improved process effectiveness and flexibility. Although studies on BPM have been continuously evolving, some research gaps still remain open. The traditional understanding of process management seems particularly vital to organizations in developing economies, which sometimes follow practices and models that were designed and tested in highly developed countries, but should also be committed to drawing on their own experience and understanding of their local business environment (Gabryelczyk & Roztocki, 2018). Research on BPM in this traditional focus is still needed to better document, implement and improve idiosyncratic business processes in the context of an organization, environment, culture, and country. This is also confirmed by research conducted under the JEMI Special Issue on Business Process Management. Besides the traditionally shaped approach to BPM, organizations increasingly treat BPM as a driver of organizational innovation and as an essential part of the digital transformation (Vom Brocke & Schmiedel, 2015). New digital technologies such as social media, digital platforms, big data and advanced data analytics, blockchains, robotics, etc., enable development and growth in a constantly changing environment. To take advantage of these opportunities in the digital world, organizations require new BPM competences and capabilities. However, digital disruption creates quite a challenge for the BPM research community. How can BPM capabilities be developed in order to achieve adaptability, growth, flexibility, and agility? How can BPM foster innovations within and throughout organizations? These are just some of the issues for future BPM-related research. Threads associated with employing BPM for digital transformation have been included in a proposed Special Issue on BPM. This Special Issue on BPM consists of six articles including contributions from invited authors from three transition economies: Croatia, Slovakia, and Poland. All of the papers focus on applications of the process approach to management or directly to the adoption of Business Process Management. The majority of articles relate to the traditional BPM thread, although the indicated BPM alliances with other concepts such as Knowledge Management, Change Management, and Project Management are worthy of note. Only one article addresses the topic of BPM in the context of digital transformation. The nature and structure of these articles may be indicative of the current motivational factors and process maturity levels of organizations adopting ordinary and/or advanced BPM practices. When analyzing the content of individual articles, we pay attention to the factors underlying BPM adoption. We understand the primary motivation to be the expected benefits from BPM. Therefore, we can assume this Special Issue to be a contribution to BPM development in the form of the indicating motivation and triggers for BPM adoption. The first paper, by Jerzy Auksztol and Magdalena Chomuszko,

proposes a process-based approach to construct a Data Control Framework for Standard Audit File for Tax (SAF-T). The process approach is used to redesign the internal financial control processes and procedures of an organization to meet the new requirements of a fiscal audit. The process approach, combined with risk management and quality management, is, therefore, a tool supporting entrepreneurs adapting to new regulations imposed on them by their external environment, particularly those of tax authorities. Therefore, in this case, the main motivation for adopting elements of BPM was the impact of external environment factors. The paper by Ana-Marija Stjepić, Lucija Ivančić, and Dalia Suša Vugec focuses on the link between Business Process Management and digital transformation. The authors have developed a theoretical framework for the emerging role of BPM in digitalization and as a guide for researchers and practitioners conducting digital transformation initiatives in organizations. The results obtained in the article prove that the set goals and expected benefits of digital transformation can be achieved by a rethink and improvement of the processes, with a particular focus on end-to-end customer processes through supply chain management. Based on this article, we can conclude that one of the main motivational factors for BPM adoption is a desire to obtain the benefits of digital transformation. The article written by Miroslava Nyulásziová and Dana Paľová takes up the issues of using and linking the process approach and BPM lifecycle with the designing of decision support systems. The authors of this paper have developed an innovative system for decision support by implementing modeling, analysis, and improvement methods to the transportation process in the studied organization. The forwarding company's case study presented in the paper also shows how BPM adoption began with a single main process that has been streamlined and automated. Therefore, the motivations for BPM adoption were not only operational, relating to the optimization of the cost of the process, but also managerial, oriented on improving the decision-making process. The use of information technology allowed the full exploitation of the potential for process improvements. The next paper by Olga Sobolewska is about incorporating the issues of BPM into the contemporary challenges of network organizations. The author claims that the organization's orientation towards both business processes and knowledge management is a strong success factor for network cooperation. The author argues that modern organizations should focus on managing knowledge-oriented processes to become attractive to cooperation partners for network organizations. In this article, BPM adoption is of a strategic nature for the purposes of undertaking new forms of cooperation. The paper by Hubert Bogumił has an interdisciplinary character and, in a unique way, shows the connections between the concepts of process management, organizational change management, and IT project management. The author undertook the challenge of examining how problems for organizations managing IT projects facilitate in different ways the use of distinctive approaches to improve business processes. The author emphasizes that the main difficulty is the fact that modern organizations most often use a hybrid approach, with elements of both traditional project management and agile. The need to create a work environment that takes into account the risk of unexpected system and business regression, as well as a diagnosis of the causes and methods of its mitigation, is the initial research result in this paper. This article contributes to the development of BPM governance and integration of IT governance. The motivational factors for BPM are multi-faceted, as is the scope of the article. However, their managerial and cultural character (related to methods of communication and rules of cooperation in teams) should be emphasized. The article by Agnieszka Bitkowska concerns the integration of the concept of Knowledge Management and BPM. The author restates in her article that the identification, acquisition, presentation and documentation of knowledge are not independent tasks, but are implemented within business processes. In this paper, the correlations between BPM and Knowledge Management have been examined and the benefits and practical implications resulting from the integrated implementation of both concepts are emphasized. In the case of this article, BPM adoption can be a success factor for the implementation of Knowledge Management and the achievement of associated benefits. Studying Business Process Management from the different angles presented in this Special Issue should enrich our understanding of current BPM practices and better realize future challenges, especially those related to BPM development in

the context of digital transformation and the integration of BPM with other management-related concepts. In addition, the contribution made by the authors of this Special Issue allowed us to see various motivations and triggers for BPM adoption, from operational, to managerial, strategic, cultural and technological ones, and those driven by the external environment. We would like to thank the authors for their contribution to this Special Issue. We would also like to thank all the reviewers for their valuable comments, which helped the authors improve their articles significantly. We are firmly convinced that the BPM research results presented in this Special Issue will help strengthen the existing body of BPM knowledge. We recommend reading the related issue of the JEMI journal to the wider community of BPM researchers, practitioners, and enthusiasts. Guest Editors Renata Gabryelczyk, Tomislav HERNÁUS Acknowledgments The editorial work on this Special Issue was supported by the Polish National Science Centre, Poland, Grant No.
