acls manual 2020 pdf: Antimicrobial Resistance and Therapy in Critically Ill Patients Jian-cang Zhou, Lei Fang, Fuhong Su, 2023-11-02 The Centers for Disease Control and Prevention of the United States has deemed extended-spectrum β -lactamases (ESBLs)-producing Enterobacterales and multidrug-resistant (MDR) *Pseudomonas aeruginosa* as serious threats and carbapenem-resistant (CR) Enterobacterales (CRE) and CR *Acinetobacter* as urgent threats. Due to the prevalent drug resistance of these strains and lack of antimicrobial alternatives, the treatment of infections caused by these MDR Gram-negative pathogens rely on tigecycline, polymyxins (colistin and polymyxin B) or new β -lactam/ β -lactamase inhibitor combinations (such as ceftazidime-avibactam, CAZ/AVI). However, the critically ill patients with antimicrobial infection are associated with high mortality. Hence, the prevalence and optimal therapy for critically ill patients with antimicrobial resistance are worth further study.
