american chemical society practice exam: *Science in the Context of Application* Martin Carrier, Alfred Nordmann, 2010-11-12 We increasingly view the world around us as a product of science and technology. Accordingly, we have begun to appreciate that science does not take its problems only from nature and then produces technological applications, but that the very problems of scientific research themselves are generated by science and technology. Simultaneously, problems like global warming, the toxicology of nanoparticles, or the use of renewable energies are constituted by many factors that interact with great complexity. Science in the context of application is challenged to gain new understanding and control of such complexity—it cannot seek shelter in the ivory tower or simply pursue its internal quest for understanding and gradual improvement of grand theories. Science in the Context of Application will identify, explore and assess these changes. Part I considers the Changing Conditions of Scientific Research and part II Science, Values, and Society. Examples are drawn from pharmaceutical research, the information sciences, simulation modelling, nanotechnology, cancer research, the effects of commercialization, and many other fields. The book assembles papers from well-known European and American Science Studies scholars like Bernadette Bensaude-Vincent, Janet Kourany, Michael Mahoney, Margaret Morrison, Hans-Jörg Rheinberger, Arie Rip, Dan Sarewitz, Peter Weingart, and others. The individual chapters are written to address anyone who is concerned about the role of contemporary science in society, including scientists, philosophers, and policy makers.

american chemical society practice exam: *Grading for Growth* David Clark, Robert Talbert, 2023-07-03 Are you satisfied with your current and traditional grading system? Does it accurately reflect your students' learning and progress? Can it be gamed? Does it lead to grade-grubbing and friction with your students? The authors of this book – two professors of mathematics with input from colleagues across disciplines and institutions – offer readers a fundamentally more effective and authentic approach to grading that they have implemented for over a decade. Recognizing that traditional grading penalizes students in the learning process by depriving them of the formative

feedback that is fundamental to improvement, the authors offer alternative strategies that encourage revision and growth. Alternative grading is concerned with students' eventual level of understanding. This leads to big changes: Students take time to review past failures and learn from them. Conversations shift from "why did I lose a point for this" to productive discussions of content and process. Alternative grading can be used successfully at any level, in any situation, and any discipline, in classes that range from seminars to large multi-section lectures. This book offers a comprehensive introduction to alternative grading, beginning with a framework and rationale for implementation and evidence of its effectiveness. The heart of the book includes detailed examples – including variations on Standards-Based Grading, Specifications Grading, and ungrading -- of how alternative grading practices are used in all kinds of classroom environments, disciplines and institutions with a focus on first-hand accounts by faculty who share their practices and experience. The book includes a workbook chapter that takes readers through a step-by-step process for building a prototype of their own alternatively graded class and ends with concrete, practical, time-tested advice for new practitioners. The underlying principles of alternative grading involve: Evaluating student work using clearly defined and context-appropriate content standards. Giving students helpful, actionable feedback. Summarizing the feedback with marks that indicate progress rather than arbitrary numbers. Allowing students to revise without penalty, using the feedback they receive, until the standards are met or exceeded. This book is intended for faculty interested in exploring alternative forms of learning assessment as well as those currently using alternative grading systems who are looking for ideas and options to refine practice.

american chemical society practice exam: POGIL Shawn R. Simonson, 2023-07-03 Process Oriented Guided Inquiry Learning (POGIL) is a pedagogy that is based on research on how people learn and has been shown to lead to better student outcomes in many contexts and in a variety of academic disciplines. Beyond facilitating students' mastery of a discipline, it promotes vital educational outcomes such as communication skills and critical thinking. Its active international community of practitioners provides accessible educational development and support for anyone developing related courses. Having started as a process developed by a group of chemistry professors focused on helping their students better grasp the concepts of general chemistry, The POGIL Project has grown into a dynamic organization of committed instructors who help each other transform classrooms and improve student success, develop curricular materials to assist this process, conduct research expanding what is known about learning and teaching, and provide professional development and collegiality from elementary teachers to college professors. As a pedagogy it has been shown to be effective in a variety of content areas and at different educational levels. This is an introduction to the process and the community. Every POGIL classroom is different and is a reflection of the uniqueness of the particular context – the institution, department, physical space, student body, and instructor – but follows a common structure in which students work cooperatively in self-managed small groups of three or four. The group work is focused on activities that are carefully designed and scaffolded to enable students to develop important concepts or to deepen and refine their understanding of those ideas or concepts for themselves, based entirely on data provided in class, not on prior reading of the textbook or other introduction to the topic. The learning environment is structured to support the development of process skills -- such as teamwork, effective communication, information processing, problem solving, and critical thinking. The instructor's role is to facilitate the development of student concepts and process skills, not to simply deliver content to the students. The first part of this book introduces the theoretical and philosophical foundations of POGIL pedagogy and summarizes the literature demonstrating its efficacy. The second part of the book focusses on implementing POGIL, covering the formation and effective management of student teams, offering guidance on the selection and writing of POGIL activities, as well as on facilitation, teaching large classes, and assessment. The book concludes with

examples of implementation in STEM and non-STEM disciplines as well as guidance on how to get started. Appendices provide additional resources and information about The POGIL Project.
