Reading involves decoding and comprehension components, and to become efficient it requires a large number of cognitive and linguistic processes. Among those, decoding failures can have different origins, such as deficits in phonological and/or visual processing. In addition, a child with reading difficulties might also have problems in the acquisition of writing and handwriting performance. This is an important point to be discussed, as reading and writing both suffer interference from vocabulary acquisition, linguistic skills, memory skills, reading and writing practices, and literacy methods. These processes become important only when the professional needs to deal with students presenting learning difficulties. Difficulty in using the knowledge of conversion rules between grapheme-phoneme to word reading construction or phoneme-grapheme for writing can be identified in schoolchildren with dyslexia, dysgraphia, and dysortography, being a specific learning disorder with a neurological etiology. In addition, there is established evidence of a speech-language processing basis, students with specific learning disabilities can show a range of cognitive difficulties (e.g., rapid naming, executive functioning, working memory). These presented difficulties interfere in their learning process, impairing their learning development.
