- Rib cage (ribs and sternum)

Appendicular Skeleton

The appendicular skeleton comprises the limbs and girdles that attach the limbs to the axial skeleton.

Main bones of the appendicular skeleton:

- Pectoral girdles (clavicles and scapulae)
- Upper limbs (humerus, radius, ulna, carpals, metacarpals, phalanges)
- Pelvic girdle (hip bones)

blank skeletal system diagram: Kingly Crafts Yung-ti Li, 2022-12-20 The site of Anyang, the last capital of the Shang dynasty, dated to around 1200 to 1000 BCE, is one of the most important sources of knowledge about craft production in Bronze Age China. Excavations and research of the settlement over the past ninety years demonstrate both the advanced level of Shang craft workers and the scale and capacity of the craft industries of the time. However, materials unearthed in Anyang by different expeditions have since been stored separately in China and Taiwan, making a thorough study of this important aspect of life in Shang China challenging. Despite efforts to integrate the data based on published material, the physical evidence rarely has been considered as a single group. Through a systematic analysis of the archaeological materials available in both China and Taiwan, Yung-ti Li provides a detailed picture of craft production in Anyang and paves the way for a new understanding of how the Shang capital functioned as a metropolis. Focusing on craft-producing activities, including bronze casting, bone working, shell and marble inlay working, lithic working, and pottery production, Kingly Crafts examines the material remains, the technology, and the production organization of the craft industries. Although the level of Shang craftsmanship can be seen in the finished products, Li demonstrates that it is necessary to study workshop remains and their archaeological context to reconstruct the social and political contexts of craft production. Offering a comprehensive investigation of these remains, Kingly Crafts sheds new light on the relationships between craft industries and political authority in the late Shang period.

blank skeletal system diagram: Human Ecology of Beringia John F. Hoffecker, Scott A. Elias, 2007 Twenty-five thousand years ago, sea level fell more than 400 feet below its present position as a consequence of the growth of immense ice sheets in the Northern Hemisphere. A dry plain stretching 1,000 miles from the Arctic Ocean to the Aleutians became exposed between northeast Asia and Alaska, and across that plain, most likely, walked the first people of the New World. This book describes what is known about these people and the now partly submerged land, named Beringia, which they settled during the final millennia of the Ice Age. Humans first occupied Beringia during a twilight period when rising sea levels had not yet caught up with warming climates. Although the land bridge between northeast Asia and Alaska was still present, warmer and wetter climates were rapidly transforming the Beringian steppe into shrub tundra. This volume synthesizes current research-some previously unpublished-on the archaeological sites and rapidly changing climates and biota of the period, suggesting that the absence of woody shrubs to help fire bone fuel may have been the barrier to earlier settlement, and that from the outset the Beringians developed a postglacial economy similar to that of later northern interior peoples. The book opens

with a review of current research and the major problems and debates regarding the environment and archaeology of Beringia. It then describes Beringian environments and the controversies surrounding their interpretation; traces the evolving adaptations of early humans to the cold environments of northern Eurasia, which set the stage for the settlement of Beringia; and provides a detailed account of the archaeological record in three chapters, each of which is focused on a specific slice of time between 15,000 and 11,500 years ago. In conclusion, the authors present an interpretive summary of the human ecology of Beringia and discuss its relationship to the wider problem of the peopling of the New World.
