## What is an Equation of a Circle?

### Definition and Basic Concepts

An equation of a circle represents all the points in a plane that are equidistant from a fixed point called the center. The standard form of the circle's equation is:

$$\sqrt{(x - h)^2 + (y - k)^2} = r$$

where:

- $(h, k)$  are the coordinates of the center,
- $r$  is the radius of the circle.

Understanding this form allows students to determine the circle's center and radius directly from its equation.

## Other Forms of the Equation

Apart from the standard form, there are other representations:

- General form:  $x^2 + y^2 + Dx + Ey + F = 0$
- Parametric form: expressing points on the circle using parameters

Each form has its utility depending on the problem context.
