northeast region landforms: Geomorphology of the Northeast Region of Brazil Vanda Claudino-Sales, José Falcão Sobrinho, 2024-08-09 The Brazilian Northeast, comprising 1,600,000 km² and nine States (Alagoas, Bahia, Ceará, Maranhão, Paraíba, Pernambuco, Piauí, Rio Grande do Norte, Sergipe), has an enormous diversity of geomorphological landscapes. Despite the wealth of relief, the available studies do not present, in detail, the regional geomorphological elements. However, it is necessary to allow the advancement of geographic science and related areas, create appropriate processes for the use and occupation of geographic space, guide land-use planning and environmental planning, and encourage conservationist practices. The chapters, written by the best geomorphological specialists in each segment, present unique, rich, and unpublished material that treats the reality of the geomorphological landscape in the Brazilian Northeast. It starts with a theoretical discussion on advances in the analysis of geomorphology by State, showing an unprecedented and functional geographic division.

northeast region landforms: Landforms and Landscape Evolution of the Equatorial Margin of Northeast Brazil Jean-Pierre Peulvast, François Bétard, 2015-05-30 More than a simple monograph, the authors present a comprehensive geomorphic overview of a large tropical region where they show how deciphering the long-term landform evolution helps understanding the present set of landscapes and morphodynamic environments. The Equatorial margin of the Brazilian "Nordeste" displays stratigraphic landmarks whose interpretation reveals the age and nature of landforms, leading to a reconstruction of the geomorphic history by the means of combined morphostratigraphic and morphopedological approaches. Beyond the role of differential erosion related to moderate post-oceanic opening uplift, the plain and upland landscape reflects a juxtaposition of landform and soil generations related to a shallow basin inversion, the last stages of which occurred in semi-arid conditions since the Oligocene. These results throw light on old debates on models of long-term landform development in platform areas, and also help evaluating recent models of denudation and burial based on thermochronological methods.

northeast region landforms: A Geography of New Jersey Charles A. Stansfield, 1998 The book is chock full of nuggets of information on all aspects of New Jersey from the beginning of the colonial period to the mid-1990s.-Harbans Singh, Montclair State University This is an up-to-date, comprehensive and well-written text that will appeal to both the student and the general reader. I shall make it required reading for my course on the geography of the state.-Peter O. Wacker, professor of geography, Rutgers University More than an ecological primer, this book provides essential social and economic information. Over one hundred figures and forty-five tables capture details to support the straightforward prose, and an annotated bibliography leads the reader on.-New Jersey Monthly While the second edition is similar to the first, only with more up-to-date statistics, improved maps and figures, and organization, the material covered is factually interesting. Following an introduction . . . there are several chapters on the physical geography. . . . These are followed by interesting chapters on managing physical environments, human ecology and early European settlements, including excellent sections on historical geography. . . . The number and informational content of the maps is far superior in the second edition. The book is of value for use in either a high school or university regional geography class. Stansfield must be commended for his

writing style that holds the interest and for his knowledgeable selection of materials to be included. The Pennsylvania Geographer New Jersey is the city in the garden. It is a bundle of paradoxes-a highly industrialized state famous for its seashore and mountain resorts; fairly conservative politically, it nonetheless pioneered state land use, zoning, and environmental protection legislation. The only state to be characterized by the U.S. Census as entirely metropolitan, New Jersey has the highest population density in the nation. It is a highly suburbanized state that remains important agriculturally-both very large and very small farms continue to multiply. New Jersey is also a state where widespread suburbanization of residents, shopping, and jobs has affected the most remote corners. At the same time, massive immigration is revitalizing urban centers and dramatically changing the demographics of the state. New Jersey represents both a microcosm of the United States and a leading indicator of future trends in the nation. This updated edition of this classic text features nearly 100 maps and illustrations. Charles A. Stansfield Jr. instructs readers on all aspects of New Jersey geography and provides a detailed analysis of the state's topography, management of physical environments, human ecology, early European settlement, cultural landscapes, population characteristics, race and ethnicity, transportation, agriculture, industrial development, recreation and tourism, and regions. Charles A. Stansfield Jr. is a professor of geography at Rowan University, Glassboro, New Jersey.

northeast region landforms: Landforms of Iowa Jean Cutler Prior, 1991

northeast region landforms: *Landscapes and Landforms of Eastern Canada* Olav Slaymaker, Norm Catto, 2020-02-13 This critical book focuses on the geomorphological landscapes of eastern Canada and provides a companion volume to "Landscapes and Landforms of Western Canada" (2017). There are a number of unique characteristics of eastern Canada's landscapes, notably its magnificent coastlines, the extraordinary variety and extent of wetlands, the huge Great Lakes-St. Lawrence basin, the high incidence of meteorite craters, the spectacular Niagara Falls, urban karst in Montreal and Ottawa, youthful, glaciated karst in Ontario, Newfoundland, Quebec and Nova Scotia, the ubiquitous permafrost terrain of Nunavut, Labrador and northern Quebec and the magnificent arctic fjords and glaciers. Looking at coastlines, the tidal extremes of the Bay of Fundy are world renowned; the structural complexity of the island of Newfoundland is less well known, but produces an astounding variety of coastlines in close succession; the arctic fjordlands of Baffin and Ellesmere islands and the extravagant raised beaches of Hudson Bay bear comparison with the classic fjords of Norway and the Baltic Sea raised beaches. As for wetlands, there are distinctive Arctic, Subarctic, Boreal, Eastern Temperate and Atlantic wetlands, and their extent is second only to those of Russia. In the Hudson and James Bay regions, between 75-100% of the terrestrial surface is comprised of wetlands. One of North America's largest river basins, the Great Lakes-St. Lawrence basin, has its source in Minnesota, straddles the USA-Canada border and debouches into Quebec as the St. Lawrence River and evolves through its estuary into the Gulf of St. Lawrence, a journey of almost 5,000 km. As far as meteorite craters are concerned, 10% of the world's total are located in eastern Canada, including some of the largest and most complex landforms. They are preserved preferentially in the ancient Shield terrain of Quebec. Finally, the three million km² of permafrost controlled relief in eastern Canada serves as a reminder of the vulnerability of eastern Canada's landscapes to climate change. Effects of warming are expressed through thawing of the permafrost, disruption of transportation corridors and urban construction problems, ever-present geomorphic hazards.

northeast region landforms: *Landscapes and Landforms of the Central Sahara* Jasper Knight, Stefania Merlo, Andrea Zerboni, 2024-01-02 This book describes the Central Sahara region, bringing together an unprecedented combination of diverse and often historic research published in different languages in order to describe its varied landscapes and landforms. The Central Sahara region consists of Libya, Algeria, Mali, Niger and Chad, countries that share similar landscape histories and common landscape traits, including massifs, sand seas, paleowater features and large depressions. Furthermore, human settlement of this region goes hand-in-hand with climate and environmental changes and landscape evolution during the Holocene and earlier; hence, Central Saharan

landscapes and landforms provide valuable insights into landscape–human relationships over long timescales. The book offers a comprehensive yet accessible reference source, drawing on both past and present interdisciplinary research and gathering the insights of authors from many different countries to explore a region that has largely been overlooked in available literature.

northeast region landforms: Landscapes and Landforms of Western Canada Olav Slaymaker, 2016-12-01 This is the only book to focus on the geomorphological landscapes of Canada West. It outlines the little-appreciated diversity of Canada's landscapes, and the nature of the geomorphological landscape, which deserves wider publicity. Three of the most important geomorphological facts related to Canada are that 90% of its total area emerged from ice-sheet cover relatively recently, from a geological perspective; permafrost underlies 50% of its landmass and the country enjoys the benefits of having three oceans as its borders: the Arctic, Pacific and Atlantic oceans. Canada West is a land of extreme contrasts — from the rugged Cordillera to the wide open spaces of the Prairies; from the humid west-coast forests to the semi-desert in the interior of British Columbia and from the vast Mackenzie river system of the to small, steep, cascading streams on Vancouver Island. The thickest Canadian permafrost is found in the Yukon and extensive areas of the Cordillera are underlain by sporadic permafrost side-by-side with the never-glaciated plateaus of the Yukon. One of the curiosities of Canada West is the presence of volcanic landforms, extruded through the ice cover of the late Pleistocene and Holocene epochs, which have also left a strong imprint on the landscape. The Mackenzie and Fraser deltas provide the contrast of large river deltas, debouching respectively into the Arctic and Pacific oceans.

northeast region landforms: Guide to Kansas Architecture David H. Sachs, George Ehrlich, 1996 Some were designed in elaborate styles bearing elegant names—Beaux-Arts, French Renaissance, Art Deco. Others were humbly handcrafted from easily accessible materials—wood, stone, and sod. But whether courtly, colloquial, capricious, or curious, each of the state's architectural configurations has become an aesthetic slice of Kansas. In *Guide to Kansas Architecture*, David Sachs and George Ehrlich spotlight hundreds of these surprisingly diverse homes, businesses, schools, churches, courthouses, theaters, bridges, and barns spread throughout all 105 counties. Encompassing the historical and contemporary, the vernacular and singular, this book features Victorian masterpieces, stately courthouses, and split-level suburban homes alongside the likes of the world's most beautiful gas station and Big Brutus, the enormous electric coal shovel turned museum. Illustrating where, how, and why Kansans assembled and altered their physical surroundings, the authors have amassed information on 700 structures—including descriptions, construction dates, architects, historical background, and unusual traits. They also provide maps and addresses to make them easy to find. This one-of-a-kind guide for Kansas underscores architecture's bond with the state's artistic, cultural, historical, social, political, and economic attributes and idiosyncrasies. As a handy reference and traveling companion, it will be invaluable to the well-versed architect, preservationist, or historian, as well as to the merely inquisitive and adventurous.

northeast region landforms: Landscapes and Landforms of Austria Christine Embleton-Hamann, 2022-05-20 This book intends to identify and publicize the unique features of Austrian geomorphology. In a country, which stretches from the core of the European Alps to the Hungarian plain, there is huge variety of landforms and landscapes. This book reveals that variety. Part 1 sets the context of the Austrian landscape as a whole. Part 2 is the core of the volume and comprises a careful selection of the most outstanding landscapes in Austria. Each of the chapters results from detailed research conducted by an author over many years. Austria's landscapes are especially attractive because of the great variety of topographic slopes, geologic foundations and the special landscape legacy from the Quaternary period. Glacial and Karst landscapes dominate, but there are superb examples of granite weathering landscapes and geologically recent volcanism. The

book is lavishly illustrated with about 350 color images and is securely based on scientific scholarship.

northeast region landforms: Advances in Irish Quaternary Studies Peter Coxon, Stephen McCarron, Fraser Mitchell, 2016-10-20 This book provides a new synthesis of the published research on the Quaternary of Ireland. It reviews a number of significant advances in the last three decades on the understanding of the pattern and chronology of the Irish Quaternary glacial, interglacial, floristic and occupation records. Those utilising the latest technology have enabled significant advances in geochronology using accelerated mass spectrometry, cosmogenic nuclide extraction and optically stimulated luminescence amongst others. This has been commensurate with high-resolution geomorphological mapping of the Irish land surface and continental shelf using a wide range of remote sensing techniques including MBES and LIDAR. Thus the time is ideal for a state of the art publication, which provides a series of authoritative reviews of the Irish Quaternary incorporating these most recent advances.

It also features numerous case studies describing the most striking sites, and offers insights into the status and value of geoheritage and geoconservation in the country. Providing readers with an opportunity to explore the variety of Norwegian landscapes and landforms through informative texts richly illustrated with color maps and photos, the book will appeal to scientists, scholars and any readers interested in geology, physical geography, geomorphology, landscape tourism, geoheritage and environmental protection.

northeast region landforms: Landscapes and Landforms of Nigeria Adetoye Faniran, Lawrence Kosoko Jeje, Olutoyin A. Fashae, Adeyemi O. Olusola, 2023-02-28 The book deals with the most striking landscapes and landforms of Nigeria. Attention is paid to the diversity of geomorphic features found in the country, from the coast to the extreme north, approached geographically at the national, regional and local scales, with a view to highlight the combined influence of geological, climatic, biotic and anthropogenic influences, as well as geoheritage potentials. The topics and sites described range from the mainly depositional coastal lagoons and inlets, the most prominent of which is the oil rich Niger Delta, characterized by the mangrove and rain forest, both of which have been seriously modified by human impact; through the coastal lowlands and associated hill country, with derived, deciduous and dry forest vegetation; the very prominent Niger/Benue Trough and associated features; the savanna-semi desert covered high plains of the north and the Chad Basin, each of which features spectacular landscapes and landforms, including human-made forms such as cities and cityscapes. The book provides the readers with the opportunity to explore the variety of Nigerian landscapes and landforms through informative texts illustrated with color maps and photos: it will be relevant to scientists/scholars as well as others interested in the geology, physical geography, geomorphology, landscape, tourism and other geoheritage-related information about the country.

northeast region landforms: Ethnobotany of the Mountain Regions of Brazil Reinaldo Farias Paiva de Lucena, Denise Dias da Cruz, 2023-07-09 Research in recent years has increasingly shifted away from purely academic research, and into applied aspects of the discipline, including climate change research, conservation, and sustainable development. It has by now widely been recognized that "traditional" knowledge is always in flux and adapting to a quickly changing environment. Trends of globalization, especially the globalization of plant markets, have greatly influenced how plant resources are managed nowadays. While ethnobotanical studies are now available from many regions of the world, no comprehensive encyclopedic series focusing on the world's mountain regions is available in the market. Scholars in plant sciences worldwide will be interested in this website and its dynamic content. The field (and thus the market) of ethnobotany and ethnopharmacology has grown considerably in recent years. Student interest is on the rise, attendance at professional conferences has grown steadily, and the number of professionals calling themselves ethnobotanists has increased significantly (the various societies (Society for Economic Botany, International Society of Ethnopharmacology, Society of Ethnobiology, International Society for Ethnobiology, and many regional and national societies in the field currently have thousands of members). Growth has been most robust in BRIC countries. The objective of this new MRW on Ethnobotany of Mountain Regions is to take advantage of the increasing international interest and scholarship in the field of mountain research. We anticipate including the best and latest research on a full range of descriptive, methodological, theoretical, and applied research on the most important plants for each region. Each contribution will be scientifically rigorous and contribute to the overall field of study.

northeast region landforms: Desert Landscapes and Landforms of Iran Mehran Maghsoudi, 2020-09-29 This book offers a unique and highly illustrated overview of the desert geomorphology of Iran. It describes the different landscapes and landforms of desert areas such as ergs and badlands offering a comprehensive insight into typical fluvial and eolian forms such as playas, alluvial fans, yardangs, salt domes, dunes, hoodoos and many more. The monograph elaborates the interaction of humans with the landscapes and discusses ongoing developments in geotourism, natural heritage sites as well as the potential for geoparks. Desert Landscapes and Landforms of Iran contains many photographs, satellite images, high-resolution aerial photos, maps, charts and tables which build a nice framework for the assessment of the different geomorphological features. It constitutes a comprehensive introduction for researchers and students of many disciplines in the fields of geography, geosciences, tourism and leisure studies, environmental sciences and landscape planning interested in typical physical characteristics of desert landscapes.
